APPENDICES

Executive Summary

Arcadis Consulting (UK) Limited has been commissioned on behalf of Otterpool Park LLP to undertake a Biodiversity Net Gain assessment to inform an Environmental Impact Assessment (EIA) for the proposed Development to accompany an amendment to the outline planning application. The proposed Development is 'Otterpool Park', a garden settlement located within Folkestone, Kent. The development area has been identified as an 'area of search'; hereafter, the area of search is referred to as "the site".

The site is located within Folkestone, Kent within the administrative boundary of Folkestone and Hythe District Council (F&HDC) and spans a large area located immediately south of Junction 11 of the M20. The site is largely agricultural in nature with the majority of the site comprising arable and pasture fields, a disused horseracing course with an artificial lake ('Folkestone Racecourse Lake'), areas modified from historical use (airfields), existing historic settlements and relatively new industrial areas. The site area encompasses the proposed Otterpool Park Area Development).

In line with the Environment Act (2021), 25 Year Plan for the Environment (HM Government, 2018) and the National Planning Policy Framework (MHCLG, 2019), new development should identify and pursue opportunities for securing measurable net gains for biodiversity and for the wider environment.

This report discusses the methodology for demonstrating how the outline application can achieve biodiversity net gain (in line with planning policies). The calculation applied to the baseline and an illustrative masterplan (which demonstrates a way that the development could be delivered within parameters fixed at planning) is that in the Biodiversity Metric (BM) 3.0 (Panks *et al.*, 2021a).

When considering baseline conditions, the BM 3.0 metric takes account of two values. First, it is necessary to assign a Distinctiveness value on the scale; Low (2), Medium (4), High (6), and Very High (8) The second is the Condition of the habitat on the scale; Poor (1), Moderate (2) and Good (3). The Condition assessment utilised is that provided in the BM3.0 guidance. Where valuations for habitats are open to interpretation, a higher valuation was always utilised as a precautionary approach.

Post development, the different 'typologies' of GI (Green Infrastructure) were assessed for their biodiversity value, based upon the areas and types of habitats within the typology. The valuation of these habitats is also based on their Condition and Distinctiveness, but also takes into account the difficulty and time taken to create these habitats.

Parameters for the built development parcels were also compiled, which allow for a 'Biodiversity Unit' (BU) value to be applied to these areas of the site (as the design of these areas will ensure that they have biodiversity value).

The before and after Development calculations allow for a BU valuation of biodiversity change to be calculated.

Overall, there is the potential for the Development to achieve a BU valuation change from 2021.05 BU to 2455.82 BU, an increase of 434.77 BU, or an approximately 22% increase overall.

The development also has the potential to deliver an uplift in the BU attributable to hedgerows from 131.65 BU to 232.78 BU, or an approximate 75% increase.

The development also has the potential to deliver an uplift in the BU attributable to rivers from 73.69 BU to 85.19 BU, or an approximate 15.6% increase.

This change is largely due to:

- Ensuring the development avoids the most valuable areas;
- Buffering features such as the river corridor and woodlands in appropriate, high quality habitats;

- Creation of new areas of valuable habitat, including wetlands, ponds, areas of tree planting etc;
- Inclusion of over 50% GI within the development;
- Maximisation of the ecological value of the built development areas (including the inclusion of hedgerow).

In conclusion, the net gain calculations presented demonstrate that the proposed Otterpool Park Development can achieve biodiversity net gain and therefore comply with relevant planning policies and national requirements in the Environment Act that require this.

1 Introduction

1.1 Background

1.1.1 Arcadis Consulting (UK) Limited has been commissioned on behalf of Otterpool Park LLP to undertake a Biodiversity Net Gain assessment to inform an Environmental Impact Assessment (EIA) for the proposed Development to accompany an amendment to the outline planning application. The proposed Development is 'Otterpool Park', a garden settlement located within Folkestone, Kent. The development area has been identified as an 'area of search'; hereafter, the area of search is referred to as "the site". This Appendix provides the biodiversity net gain calculations that are required in accordance with industry guidance (And the Environment Act 2021) to support the impact assessment of the proposed 'Otterpool Park' Development within Kent.

1.2 Site Location & Setting

1.2.1 The site is located within Folkestone, Kent within the administrative boundary of Folkestone and Hythe District Council (F&HDC) and spans a large area located immediately south of Junction 11 of the M20. The site as referred to in this report is largely agricultural in nature with the majority of the site comprising arable and pasture fields, a disused horseracing course with an artificial lake ('Folkestone Racecourse Lake'), areas modified from historical use (airfields), existing historic settlements and relatively new industrial areas.

1.2.2 The M20 motorway, Channel Tunnel Rail Link and Westenhanger Station are located to the north of the site, beyond which lie the villages of Stanford and Postling within a largely rural setting including the Kent Downs Area of Outstanding Natural Beauty (AONB). This AONB extends to the east, beyond which lies the town of Hythe, and to the south where it includes Lympne village. In addition, East Stour River flows through the site in a north-east to west direction. The site is centred on BNG TR 111 363.

1.3 Proposed Development

1.3.1 The proposed Development is located on approximately 589 ha of land as shown in Figure 1. The development proposals are submitted in outline for a new garden settlement.

1.3.2 The key documents within the outline planning application for this assessment comprise:

- The Development Specification (ES Appendix 4.1), Parameter Plans (ES Appendix 4.2) and Strategic Design Principles (ES Appendix 4.3);
- The Illustrative Masterplan (ES Appendix 4.5) which demonstrates one way in which the proposed Development could be build out within the requirements of the parameters (submitted in support); and
- Green Infrastructure Strategy (ES Appendix 4.11)(submitted in support).

1.3.3 Following consultation on the ES submitted as part of the 2019 planning application (the '2019 ES'), a 'three-tier' approach is proposed for the amended planning application and accompanying EIA. This comprises the three stages of the planning process: Tier 1 Outline Planning Application, Tier 2 detailed masterplan and Tier 3 reserved matters application. The design and mitigation will therefore evolve in line with the tiers. The table below (Table 1) outlines the proposed methodology for evolving the planning permission through the tiers in relation to biodiversity net gain.

Table 1: Methodology for the evolution of ecological mitigation through the tiered planning process

Aspect of the development	Tier 1	Tier 2	Tier 3
Biodiversity net gain	Assessment of the entire OPA development to determine if the parameter plans and illustrative masterplan can deliver the required biodiversity net gain.	No further assessment	Assessment of each Tier 3 application area as it progresses to ensure that it delivers the required net gain to deliver on the target for the entire site.

1.3.4 In line with the table above, this document assessed the potential for the proposed Development as secured within the parameter plans (ES Appendix 4.2), and deliverability demonstrated through the Illustrative Masterplan (ES Appendix 4.5) to achieve the required biodiversity net gain.

1.3.5 It must be noted that this document only assesses the potential to achieve these targets, further checks at Tier 2 and 3 for each application will be required to ensure that the potential achievements are secured.

1.3.6 It must be noted that the post construction typologies are habitat related only and may have multiple uses, for example a cycleway is hardstanding but may be used as an emergency access, but this does not impact the habitat typology.

2 Methodology

2.1 Biodiversity Metric 3.0

2.1.1 The purpose of this document is to estimate the potential net change in biodiversity of the proposed Development. This approach utilises information on the habitats and features of the site before and after the proposed habitat loss and mitigation through management to calculate a biodiversity value, utilising this information to calculate a change in the biodiversity value of the site.

2.1.2 These calculations were undertaken using the Biodiversity Metric (BM) 3.0 issued by Defra and Natural England (details can be found at Panks et al. (2021a and b)), a spreadsheet-based tool into which data can be entered to carry out biodiversity net gain calculations.

2.1.3 Data is entered into the metric using the UK habitat classification typologies. The BM 3.0 assesses area-based habitats (woodland, grassland etc) and linear features (hedgerows and rivers) separately, but through broadly the same methodology. As such, the following sections are of relevance to all of these habitat types.

2.1.4 When considering baseline conditions, the metric takes account of several factors, detailed below in Table 2. The numbers in brackets show the multipliers used by the metric for each category.

Table 2: Biodiversity Metrics Criteria

Evaluation	Values assigned	Criteria
Habitat type	UK habitat classification typologies	Based upon “species richness, rarity (at local, regional, national and international scales), and the degree to which a habitat supports species rarely found in other habitats”
Size of habitat parcel	Area measured in hectares and linear features measured in kilometres	N/A
The distinctiveness of the habitat type	Value predetermined for each habitat type on a scale of Very Low (0), Low (2), Medium (4), High (6) and Very High (8)	Distinctiveness considers the rarity of the habitat, the amount of the percentage of habitat protected in Sites of Special Scientific Interest (SSSIs), the UK Priority Habitat Status and the European Red List Categories for the habitat
The condition of each habitat parcel	Value assigned based on a scale of Poor (1), Fairly Poor (1.5), Moderate (2), Fairly Good (2.5) and Good (3). For some habitat types this is pre-determined	Condition sheets (provided in Panks et al. (2021a and b)) were used where possible to assess the condition
Whether the parcels are in locations identified as local nature priorities	Value assigned based on a scale of Low (1), Medium (1.1) and High (1.15) strategic importance	N/A

2.1.5 The following resources were used to inform the assessment:

- Environmental Statement (ES) Appendix 7.3: Habitat and Hedgerow Survey Report (2021);
- Aerial imagery (Google Earth, 2020); and
- MAGIC (2020) mapping.

Unit calculation

2.1.6 To calculate the biodiversity units of the site as a whole, the unit for each of the habitat types is calculated and then multiplied by the size of this habitat. The unit number is based upon the habitat's distinctiveness, condition and strategic significance. For non-linear habitats, such as woodland or grassland, the area of the habitat is used to assess its size, whereas length is used for linear habitats, such as hedgerows and rivers. The biodiversity unit numbers of area-based habitats and linear habitats (hedgerows and/or rivers) are separate and cannot be summed, as such they should be evaluated separately. Area based habitats and hedgerows are largely assessed in the same way and any differences are highlighted below.

2.1.7 This section describes how this proxy unit for biodiversity has been applied to the existing 'before' habitats and the proposed 'after' (post-intervention) habitats. Full details of the BM 3.0 can be found in Panks et al. (2021a and b).

Habitat size

2.1.8 The size of the different proposed habitats was calculated in ArcGIS.

Habitat distinctiveness

2.1.9 The metric assigns a pre-defined distinctiveness band to each of the habitats and linear features.

Area based habitats

2.1.10 As detailed in Panks et al. (2021a), this assessment is based upon "species richness, rarity (at local, regional, national and international scales), and the degree to which a habitat supports species rarely found in other habitats". Table 3 provides detail of the bandings to which each area-based habitat is assigned.

Table 3: Area based habitat distinctiveness valuation bandings

Distinctiveness band	Multiplier	Typical habitats
Very High	8	Priority habitats as defined in Section 41 of the Natural Environment and Rural Communities (NERC) Act (HMSO, 2006) that are highly threatened, internationally scarce and require conservation action e.g. blanket bog Small amount of remaining habitat with a high proportion unprotected by designation. Endangered or Critical European red list habitats.
High	6	Priority habitats as defined in Section 41 of the NERC Act (HMSO, 2006) requiring conservation action e.g. lowland fens Remaining Priority Habitats not in very high distinctiveness band & other red list habitats.
Medium	4	Semi-natural habitats not classed as a Priority Habitat but with significant wildlife benefit, e.g. mixed scrub.

Distinctiveness band	Multiplier	Typical habitats
		One Priority Habitat (arable field margins).
Low	2	Habitat of low biodiversity value e.g. temporary grass and clover ley. Agricultural and Urban land of lower biodiversity value.
Very low	0	Little or no biodiversity value e.g. hard standing or sealed surface Urban – artificial structures which are un-vegetated, sealed surfaces or built linear features of very low biodiversity value.

Hedgerows and lines of trees

2.1.11 The distinctiveness of hedgerows and lines of trees is based upon their physical structure, the woody species composition and any association with physical features, such as banks and ditches. An assessment of ground flora is not included within the metric. Table 4 details the distinctiveness categories of each of the types of hedgerows and line of trees. Further detail is provided in Panks et al. (2021a).

Table 4: Hedgerow distinctiveness categories and multipliers

Distinctiveness band	Multiplier	Typical habitats
Very High	8	Native species rich hedgerow with trees -with bank or ditch.
High	6	Native species rich hedgerow with trees. Native species rich hedgerow - with bank or ditch. Native hedgerow with trees - with bank or ditch.
Medium	4	Native species rich hedgerow. Native hedgerow - associated with bank or ditch. Native hedgerow with trees. Line of trees (ecologically valuable). Line of trees (ecologically valuable) - with bank or ditch.
Low	2	Native hedgerow. Line of trees. Line of trees - with bank or ditch.
Very low	1	Any hedgerow containing 20% or more canopy cover of a non-native species.

Habitat condition assessment

2.1.12 The condition of the habitat is defined as: “the biological ‘working-order’ of a habitat type judged against the perceived ecological optimum state for that particular habitat.” (Panks et al., 2021b). This provides a measure of variation in the quality of areas of the same habitat type.

Area based habitats

2.1.13 A habitat condition assessment sheet is provided for each habitat type within Panks et al. (2021b), which should be used to assign each habitat parcel to each of the categories detailed in Table 5. Each condition sheet is composed of a list of pass/fail criteria. The ratio of 'passes' to 'fails' is used to determine the habitat condition.

Table 5: Condition bandings for the habitats on the site

Category	Multiplier
Good	3
Fairly good	2.5
Moderate	2
Fairly poor	1.5
Poor	1
N/A – Agriculture	1
N/A – other	0

Hedgerows

2.1.14 A single condition sheet is provided for hedgerows, although lines of trees have a separate sheet. Both of these can be found in Panks et al. (2021b), along with the pass/fail ratios for both types of linear feature. The condition categories and multipliers are the same as shown in Table 5, but 'fairly good' and 'fairly poor' are not options.

2.1.15 Hedgerow data was taken from ES Appendix 7.3, with additional data collected during the surveys in 2020 and 2021, where this was required, and is presented in Appendix B and Figure 1.

Strategic significance assessment

2.1.16 Strategic significance assesses the value of habitats from the point of view of environmental objectives and preferred locations for biodiversity. Local and national policy was reviewed to quantify the strategic significance of each habitat area. Table 6, based upon Table 5-4 in Panks *et al*. (2021b), was used to assist with this assessment.

Table 6: Strategic significance categories and multipliers

Category	Description	Multiplier
High	High potential – area/action formally identified within a local plan, strategy or policy.	1.15
Medium	Good potential – location ecologically desirable but area/action not identified in local plan, strategy or policy.	1.1
Low	Low potential - area/action not identified in any local plan, strategy or policy. No local strategy in place.	1

2.1.17 The Kent Nature Partnership's 2020-2045 Biodiversity Strategy (2020) was used to assign strategic significance in this assessment. It does not identify locations specifically, but it does identify priority habitats for the Kent region; it is considered that this is functionally equivalent to being "within area formally identified in local strategy". Those habitats were then used as guide, alongside professional opinion, to identify habitats that are ecologically desirable for Kent but not specifically identified as with the priority habitats.

Baseline calculations

2.1.18 The number of biodiversity units provided by each habitat currently within the intervention site is calculated by multiplying the values for Distinctiveness, Condition, Strategic location and the size of each habitat in hectares (ha). Hedgerows are evaluated in the same way, but base upon their length (in km), rather than area. This value represents the baseline condition of the site, in terms of biodiversity units. Further detail can be found in Panks et al. (2021a and b). The site survey, satellite imagery (Google Earth, 2021) and MAGIC (2021) mapping were used to inform these baseline calculations.

Post-intervention calculations

2.1.19 The site is then reassessed for the conditions that will be present under the habitat creation proposal. The number of biodiversity units provided by each habitat within the site is calculated in the same way as the baseline habitats, but with the additional multipliers detailed in Table 7. Further detail regarding these multipliers is presented in 0.

Table 7: Risk components included in post-intervention calculations

Risk factor	Description
Difficulty of creating or restoring a habitat	A standard score based on how difficult the habitat type is to create.
Temporal risk	A standard score based on how long the habitat type takes to establish.

Post-intervention delivery risks

Difficulty of creating or restoring a habitat

2.1.20 This 'risk' relates to the difficulty of the habitat restoration or recreation. There are four bands, from Low difficulty to Very high difficulty, with the value multiplier shown below in Table 8.

Table 8: Difficulty categories and multiplier

Category	Multiplier
Very high	0.1
High	0.33
Medium	0.67
Low	1

2.1.21 Different habitat change scenarios are attributed different levels of risk (risk around the confidence in the successful establishment of habitats) and different multipliers are applied to reflect this. Three distinct habitat change scenarios are recognised in the Biodiversity Metric 3.0:

- **Habitat creation**. Where one habitat type is replaced by another, or the habitat is destroyed (e.g. by development works) and the same habitat is recreated.
- **Habitat enhancement.** Enhancing habitat is where one improves its distinctiveness and / or condition. An example of enhancement would be the enhancement of a derelict chalk grassland dominated by scrub and non-calcareous grasses to a continuous area of chalk grassland with managed woody species and an abundance of calcareous grasses.

2.1.22 Enhancement carries less risk and therefore can provide a greater unit uplift.

Temporal risk

2.1.23 Temporal risk is a factor of the time it takes for the habitat to reach target condition. This can be reliant on soil nutrient status, soil type and pH, site preparation, climate and the neighbouring habitats and species matrix available to colonise the new or restored habitat. The timeframe is also resource dependent. With sufficient time and resources most habitats can be recreated more rapidly but a more gradual process may be more beneficial to wildlife in the longer term.

2.1.24 For the purposes of the Defra Biodiversity Metric 3.0 average time estimates are used, accepting that there will be variation from this proxy estimate. For example, some sites will take longer, where conditions are more nutrient enriched or higher altitude or north facing. Average estimates of the time to target condition were largely expert driven and build upon the considerations that shaped judgements of the difficulty to create or restore a habitat. They were additionally informed by field experience, industry case studies and a body of practical experience. The time to target condition varies between 0 and greater than 30 years, with 0 years having a multiplier of 1. The multiplier decreases by 3.5% per year.

Spatial risk

2.1.25 A separate risk multiplier is applied to post-intervention sites outside of the site. This incentivizes the utilisation of sites near the intervention site, for ecological and social reasons. Sites within the same local planning authority area (LPA) or National Character Area (NCA), are deemed sufficiently close to address ecological and social concerns. The LPA would need to provide agreement for any offsets outside of their authority area. Higher multipliers are assigned to more distant sites, as shown in Table 9, which results in a decrease in the value of an off-site location with increasing distance.

Table 9: Off-site risk categories (LPA – local planning authority area, NCA – National Character Area)

Category	Multiplier
Compensation inside LPA or NCA of impact site.	1
Compensation outside LPA or NCA of impact site but in neighbouring LPA or NCA.	0.75
Compensation outside LPA or NCA of impact site and beyond neighbouring LPA or NCA.	0.5

‘Pseudo’ Double counting areas

2.1.26 The total area input into the tool can be greater than the total area of the site. This is due to the three-dimensional nature of certain habitats. For example, the area covered by a tree is approximately the area covered by its canopy, but if an area of grassland is underneath, both would be included in the metric. As such the area of the tree canopy is ‘counted’ twice and can result in the area in the metric being larger than the area of the site.

Calculation of gains or losses

2.1.27 The net change in biodiversity or hedgerow units on and off-site is calculated within the tool by subtracting the baseline units from the post-intervention units. The overall net change is the sum of the change in units on-site and off-site. The percentage net gain is then calculated by dividing this overall net change by the number of baseline units on the site, as shown in the equation below:

$$overall\ percentage\ net\ gain = \frac{change\ in\ units\ on\ site + change\ in\ units\ off\ site}{baseline\ units\ on\ site} \times 100$$

2.1.28 A positive value indicates a net gain has been made and a negative value indicates a net loss has been made.

Changes in broad habitat type calculations

2.1.29 The UK habitat classification system is hierarchical in structure, so specific habitat types can be grouped into broad habitat types. The changes in area and biodiversity units associated with each of these broad habitat types was calculated using the baseline and post-intervention data.

Areas excluded from the assessment

2.1.30 The metric is not designed to assess impacts to habitats within statutory designated sites or “irreplaceable” habitats, as defined in Panks et al. (2021a and b). There are no irreplaceable habitats, such as ancient woodland, or statutory designated sites present within the site, therefore all habitats are assessed.

2.2 Data Preparation, Assumptions and Limitations

Baseline Data

2.2.1 As stated above, BM 3.0 is designed to work with the UKHab Habitat Classification system, however the habitat data for the ES Appendix 7.3 in 2016-2018 was collected in the Phase 1 Habitat Classification system. As a result, the existing habitat data had to be converted into a format compatible with BM 3.0. Given that it did not exist at the time, the PEA habitat data was not collected with BM 3.0 in mind so certain assumptions had to be made on the most appropriate habitat categories and condition scores to use. In all cases a precautionary approach was undertaken to ensure that habitats were not undervalued in the absence of the appropriate data. At later stages of planning, update surveys will be undertaken that will collect data specifically for use in BM 3.0 to provide a more precise assessment. The results of this conversion from Phase 1 to UKHab, and the following condition assessment can be found in Appendix A.

Post Intervention Data

2.2.2 The Otterpool Park development is currently only in the outline stage of the planning process and as such, a detailed landscape and habitat design and management plan is not currently available. In order to carry out this assessment, the Otterpool Park Green Infrastructure Strategy (GI Strategy)(ES Appendix 4.11) was used to produce an overview of the potential habitats within the site drawing of the site that sorted it

into a number of land-use categories which was then further refined into land-use typologies where the land-use categories were found to be functionally identical, a breakdown of the conversions can be found in Appendix D . For each of these an assumption was generated of the likely habitat composition by percentage of the typology, and the likely condition of those component habitats. The percentages generated here were then combined with the area coverage of the typologies to generate the respective area coverage of each component habitat. The details of these typologies can be found in Appendix D and Appendix E, and these are presented on Figure 4.

2.2.3 The composition of the post construction habitat typologies and assumed condition of those component habitats was informed by:

- The Illustrative Masterplan;
- The Otterpool Park Green Infrastructure Strategy;
- Requirements for Sustainable Urban Drainage Systems (SuDS) and drainage;
- Habitat requirements secured within the species mitigation strategies (ES appendix 7.18);
- A precautionary approach which balances the best possible habitat that is likely achievable against the varied levels of potential impact from people who will come to live on the site;
- Cross referencing assumptions made against the BM 3.0 condition assessment sheets;
- Discussions with the project landscape and master planning teams;
- Professional opinion based on experience of what is achievable on similar developments;
- Standardised design requirements for features such as SUDs.

Rivers assessment

Baseline assessment

2.2.4 The East Stour river (along with a tributary of the river) is present within the site which required assessment through the river element of the metric.

2.2.5 Watercourses are assessed in a similar manner to area based and hedgerow habitats, with distinctiveness, condition and strategic significance being assessed. However, the assessment also includes a measure of encroachment into the riparian zone and into the watercourse. The size of watercourses is measured in their length. Each of these factors is discussed in the sections below.

2.2.6 The site surveys were undertaken between the 30th June and 2nd July 2020. The site survey includes an assessment of the extent and character of:

- Bank and bed sediments;
- Morphological and hydrological features/habitats;
- Riparian and aquatic vegetation extent and structure;
- Presence and extent of non-native invasive species;
- Bank top land pressures; and
- Human interventions within the river channel.

Watercourse length

2.2.7 The size of a watercourse is measured by its length, following the path of the watercourse.

Habitat distinctiveness

2.2.8 Watercourse habitats are classified as one of the following, each with a predetermined distinctiveness score, as shown in Table 10.

Table 10: River habitat types

Habitat	Distinctiveness
Priority habitats	Very high
Other rivers and streams	High
Canals	Medium
Ditches	Medium
Culvert	Low

Habitat condition

2.2.9 Habitat condition is assessed differently to the condition sheet approach used for area and hedgerow habitats. Condition is assessed following the MoRPh (Modular River Physical) survey methodology. This includes a site assessment and a desk-based assessment. This assessment requires training and accreditation to carry out. The methodology assesses quality indicators, such as the physical features of the water course, basic floral diversity and the presence of non-native species (see section 0 for further details). The score for each of the 32 condition indicators is determined by the results of the MoRPh survey. The positive and negative indicators score from 0 to +4 and 0 to -4 respectively. The average of the positive and negative condition indicator scores are summed, producing a preliminary condition score for each subreach. The Preliminary Condition Score is translated into a Final Condition Score (5-good, 4-fairly good, 3-moderate, 2-fairly poor, 1-poor) based upon the River Type. Cartographer software is used to carry out this analysis.

2.2.10 For the condition assessment, rivers are divided into reaches (i.e. sections) of a similar character. Changes in character that would divide reaches include the presence of a significant confluence or change in planform of the river. The condition of each of the reaches is the result of an average of the condition scores for each of the subreaches.

Strategic significance

2.2.11 As with area and hedgerow habitats, strategic significance assesses the spatial significance of habitats. The levels of strategic significance are shown in Table 11.

Table 11: Watercourse strategic significance

Distinctiveness category	Description of distinctiveness multiplier	Strategic multiplier
High	Local Plans River basin Management Plan Catchment Plans Catchment Planning System Priority Habitats for Restoration	1.15
Low	Low potential/ action not identified in any plan	1

Riparian zone

2.2.12 The riparian zone is classified as the area within 10m of the bank top. This area is included as part of the watercourse assessment due to its potential impact on the river function. This area is also included as part of the area-based assessment.

Watercourse encroachment

2.2.13 Development within the banks of the watercourse is classified as watercourse encroachment. This can either be existing development within the baseline, or new development. The watercourse encroachment bandings are shown in Table 12.

Table 12: Watercourse encroachment bands

Watercourse encroachment band	Multiplier	Description	Examples
No encroachment	1.0	<5% bank length comprising an engineered bank revetment and no encroachment into channel	N/A
Minor	0.8	5%-20% bank length comprising engineered bank revetment or encroachment up to 10% channel width	Small headwalls, jetties, pontoons
Major	0.5	>20% bank length comprising an engineered bank revetment or encroachment >10% of the channel width	Weirs, large headwalls, bank revetment.

Riparian encroachment

2.2.14 Development within the riparian zone is classified as riparian encroachment. This can either be existing development within the baseline, or new development. The levels of riparian encroachment are described in Table 13.

Table 13: Riparian encroachment bands

Riparian encroachment band	Multiplier	Description
No encroachment	1.00	No development within 10m of bank top
Minor	0.95	Any development 8-10m from bank-top (up to 100% of area) or where development footprint occupies 0-10% of the riparian zone area 4-10m from bank-top.
Moderate	0.85	Any development where footprint occupies between 10-25% of the riparian zone area 4-10m from bank-top.
Major	0.75	Any development 0-4m from bank-top (except a maximum of 5% footprint for amenity features) or where development footprint occupies >25% of the total riparian zone area.

Change scenarios

2.2.15 As with area-based habitats, watercourse habitat can be retained, enhanced or created. Retained habitats are not significantly impacted positively or negatively. Enhancing watercourses can improve distinctiveness or condition. Rivers, by their nature, cannot be created. However, there are some circumstances where it is feasible, such as diverting channels outside of their natural alignment. Ditches, canals and culverts can be created in a more straightforward manner. As with area-based habitats, appropriate risk multipliers are applied to these interventions.

Post-development assessment

2.2.16 The post-development status of the river is predicted using the same criteria as in the baseline. To predict the river condition, the post-development proposals were assessed against each of the scoring indices (see Table 2 and Appendix 2 in Gurnell et al. (2020) for further details regarding these indices). The approach was taken to assess the condition of each of the sections of the watercourses in the same manner. As each of the sections will be managed in a similar way and as proposals are currently at a high level, this level of granularity was deemed appropriate. As a result, a single assessment of the overall watercourse condition was carried out, that represented the expected character of the watercourses post-development.

3 Results

3.1 Introduction

3.1.1 This section details the results of the biodiversity net gain assessment. It first shows the results of baseline assessments for the area based habitats (Section 3.2), the hedgerows (Section 3.3), and finally the river habitats (Section 3.4). This is followed by the results of the post-intervention assessments for the area-based habitats (Section 3.5), the hedgerows (Section 3.6 and 3.7), and river habitats (Section 3.83.8).

3.2 Baseline Biodiversity Units (Area-based Habitats)

3.2.1 The site is approximately 589ha in area, however the total coverage of habitat is approximately 596.69ha due to the three-dimensional nature of some habitats (as explained in section 0). A description of the habitats considered to be present on the site in the original PEA, alongside how they were converted into UKHab typologies and their assigned condition scores, can be found in Appendix A with full condition assessments in Appendix B.

3.2.2 Given the large size of the site, a summary of the results of the baseline calculator for each habitat type present is provided in Table 14; the full calculations can be found in the associated calculator tool (Appendix F).

3.2.3 The baseline currently delivers 2021.05 biodiversity units for area habitats.

3.2.4 The habitats present on the site that were assessed for the baseline are presented in Figure 1.

Table 14: Baseline habitat value summary

UK habs/ broad habitat	UK habs/habitat type	Total Area (ha)	Strategic significance	Total BU	BU/Ha
Cropland	Cereal crops	306.9778	Area/compensation not in local strategy/ no local strategy	613.9555	2.00
Grassland	Modified grassland	228.2520	Area/compensation not in local strategy/ no local strategy	913.008	4.00
	Other neutral grassland	9.4870	Location ecologically desirable but not in local strategy	83.4852	8.80
Heathland and shrub	Mixed scrub	3.3436	Area/compensation not in local strategy/ no local strategy	16.3368	4.89
Lakes	Ponds (Non-priority habitat)	0.4180	Within area formally identified in local strategy	3.3238	7.95
	Ponds (Priority habitat)	2.3188	Within area formally identified in local strategy	43.9376	18.95
Sparsely vegetated land	Ruderal/ephemeral	3.8740	Area/compensation not in local strategy/ no local strategy	14.4158	3.72

UK habs/ broad habitat	UK habs/habitat type	Total Area (ha)	Strategic significance	Total BU	BU/Ha
Urban	Developed land; sealed surface	15.6241	Area/compensation not in local strategy/ no local strategy	0.0000	0.00
	Introduced shrub	0.4749	Area/compensation not in local strategy/ no local strategy	0.9498	2
	Urban tree	11.044	Within area formally identified in local strategy	127.01	11.5
	Vacant/derelict land/bare ground	2.3746	Area/compensation not in local strategy/ no local strategy	4.7492	2
Woodland	Lowland mixed deciduous woodland	11.2821	Within area formally identified in local strategy	162.9157	14.44
	Other woodland; broadleaved	0.9659	Location ecologically desirable but not in local strategy	5.4373	5.63
	Other woodland; mixed	3.3966	Area/compensation not in local strategy/ no local strategy	29.8463	8.00
	Wood-pasture and parkland	0.1363	Area/compensation not in local strategy/ no local strategy	4.3600	8
Totals	**N/A**	**589.33**	**N/A**	**2021.05 (due to rounding to 2 d.p.)**	**N/A**

3.2.5 The site had a total BU/Ha of 3.43BU/Ha. A visual representation of Table 14 is also presented in Figure 2.

3.3 Baseline Biodiversity Units (Hedgerows)

3.3.1 Data on hedgerows was collected on site, as reported in ES Appendix 7.3 and is shown on Figure 3. Each hedgerow was numbered from OT01 – OT66. The habitat type of each hedgerow was initially collected using 'Phase 1' typology (as presented in ES Appendix 7.3, however the data collected to inform the Hedgerow regulations assessment included sufficient information to allow these to be converted to UKHabs for the BNG assessment. The table below (Table 15) details the categorisation of the hedgerows according to UKHabs and the respective lengths of the hedgerows.

Table 15: Hedges on site in the baseline state

Hedge type	Hedge Identifier	Length (m)
Native species Rich hedge and ditch	OT8	137
	OT22	255
	OT50	225

Hedge type	Hedge Identifier	Length (m)
Native species poor hedge and ditch	OT2	292
	OT24	180
	OT25	263
	OT31	206
	OT33	239
Native species rich hedge with ditch and trees	OT1	287
	OT19	291
	OT32	190
	OT34	614
	OT62	60
	OT63	446
Native species poor hedge with ditch and trees	OT3	192
	OT4	167
	OT26	232
	OT35	300
	OT53	97

3.3.2 Condition assessments for each of the hedgerow typologies are presented in Appendix C. Hedgerows of each type were grouped for the condition assessments to make the data manageable. Where a different result in a category applied to hedgerows within a habitat type, the highest vale was used for the entire subset of hedgerow within that group. As such, the condition assessment represents a precautionary assessment of the baseline condition of the hedgerows on site.

3.4 Baseline River Conditions and Valuation

River typology

3.4.1 The watercourses on the site are not on the priority rivers map[1]. They were also not ditches, canals or culverts, so they were assessed as being 'other rivers and streams'.

River condition

3.4.2 The condition assessment of the reaches is presented in Table 16, with the locations of the reaches shown in Image 1 The condition indicator scores for each of the sub reaches in presented in Appendix F.

[1] https://naturalengland-defra.opendata.arcgis.com/datasets/priority-river-habitat-rivers-england/explore?location=52.923443%2C-1.967810%2C7.12

Table 16: Condition assessments

Reach	Condition
East stour reach 1	Moderate
East stour reach 2	Moderate
East stour reach 3	Moderate
East stour tributary reach 1	Moderate

Image 1: Reach map for watercourses within the site

Strategic significance

3.4.3 The watercourses are considered to be of strategic significance (marked as within local plans), as there is a management plan for this system[2].

Encroachment

3.4.4 Throughout all of the watercourses within the site there is not significant encroachment into the riparian zone or the channel itself. Further, any minor encroachment will not have an impact of the overall condition of the watercourses.

Baseline unit total

3.4.5 As presented in Table 17, the baseline biodiversity unit value of the river habitats is 73.69 river units.

[2] https://kentishstour.org.uk/about-the-stour-valley/our-stour/responsible-bodies/east-kent-catchment-improvement-partnership/

Table 17: Baseline River unit totals

River reach	Length (km)	Units
East stour reach 1	1.44	19.87
East stour reach 2	1.28	17.66
East stour reach 3	0.9	12.42
East stour tributary reach 1	1.72	23.74
Total	**5.34**	**73.69**

3.5 Outline Landscape Proposal

3.5.1 As previously stated, a detailed landscape plan does not currently exist for the development and so an outline plan has been produced based on land use typologies (presented in Figure 4). Several assumptions were made in the production of this plan in order to carry out the calculations:

- any existing grassland that will come to form any of the proposed parks will be protected from impact during the development process so that it can be enhanced; and
- that all other baseline habitat will be lost.

3.5.2 At later stages of design these assumptions may become invalid, however they are considered appropriate and precautionary for this stage and can be adjusted for further iterations of these calculations as the design is refined.

3.5.3 Based on this outline proposal, the post-intervention biodiversity units that could be achieved on the site, based on the current GI proposal total 2455.82BU, representing an increase in biodiversity units of 434.77, which is an 21.51% gain.

3.5.4 The typologies in the GI strategy (ES Appendix 4.11) are not habitats and are defined by their proposed purpose/s within the proposed Development. However, it is possible to estimate with a degree of confidence the habitats that will be within these typologies due to the requirement for these habitats to be included to deliver the purpose of the areas. As such each typology is subdivided into an estimated proportion of each habitat that it is likely to contain. This is used to provide a weighted overall biodiversity value for the typologies.

3.5.5 A summary of the biodiversity units generated by each land use typology on the site can be found below in Table 20, and a breakdown of the details of each land-use parcel is included in Appendix D and Appendix E. Two illustrative examples of how the details of these typologies were arrived at are provided below in Table 18 and Table 19.to show how Section 0 of the methods was applied in practice.

Table 18: Proposed Development Areas Typology Breakdown

Proposed Development Areas							
BM 3.0 Habitat Typologies Present	Percent coverage	Distinctiveness	Condition	Strategic Significance	Difficulty	Time to target condition	BU/ha
Developed land; sealed surface	45.00%	Very low	N/A	Area/compensation not in local strategy/ no local strategy	Medium	0	0.00
Vegetated garden	30.00%	Low	Poor	Area/compensation not in local strategy/ no local strategy	Low	1	1.93
Mixed scrub	5.00%	Medium	Moderate	Area/compensation not in local strategy/ no local strategy	Low	5	6.69
Intensive green roof	10.00%	Medium	Good	Location ecologically desirable but not in local strategy	Medium	10	6.19
Rain Garden	5.00%	Low	Moderate	Location ecologically desirable but not in local strategy	Low	3	3.95
Urban trees	10.00%	Medium	Moderate	Location ecologically desirable but not in local strategy	Low	27	3.36
Modified grassland	5.00%	Low	Moderate	Area/compensation not in local strategy/ no local strategy	Low	4	3.47
Total	110%	N/A	N/A	N/A	N/A	N/A	1.95

COMMENTARY

The Defra Metric 3.0 guidance advises that areas of residential development are typically comprised of an approximate 70:30 ratio of developed land; sealed surface (houses) to vegetated gardens. This basic approach was used to generate this breakdown however it was adapted slightly to account for the fact that the GI Strategy (ES Appendix 4.11) defines the proposed Development as a “garden settlement” and would therefore have a greater composition of soft landscaping than a typical development. Some of the buildings are likely to be designed to incorporate green roofs and the public areas within these parcels are also expected to include features such as tree and scrub planting, road verges and rain gardens or Sustainable Drainage Solutions (SuDS). The condition scores were guided by the likely impact the residents could have on these features i.e., the green roofs will be inaccessible and therefore management can be designed to achieve the best possible outcome, while other features such as the rain gardens are limited to moderate condition as factors including visual amenity requirements and foot traffic will limit the possible management. These assumptions are supported by experience of a development of similar scope and design that is further along in its timeline; Northstowe in South Cambridgeshire.

Table 19: Proposed Burial Ground Typology Breakdown

Proposed Burial Ground							
BM 3.0 Habitat Typologies Present	Percent coverage	Distinctiveness	Condition	Strategic Significance	Difficulty	Time to target condition	BU/ha
Developed land; sealed surface	5.00%	Very low	N/A	Area/compensation not in local strategy/ no local strategy	Medium	0	0.00
Other woodland; broadleaved	30.00%	Medium	Moderate	Within area formally identified in local strategy	Low	15	5.39
Other neutral grassland	65.00%	Medium	Good	Location ecologically desirable but not in local strategy	Low	10	9.24
Total	100%	N/A	N/A	N/A	N/A	N/A	6.28

COMMENTARY
The basis of this typology comes from comparison with other woodland burial sites throughout the UK. Such sites typically take the form of either primarily denser woodland with glades of grassland designed for ceremonies and contemplation/reflection, or a generally more open design resembling wood pasture or denser parkland. As it is not yet known what the design of this burial area will be, the more open design was chosen as this appears to be the most common. An allowance has also been made for paths that be present (developed land; sealed surface). Human presence is likely to be relatively limited and also of low intensity given the nature of the activities the area is designed for, therefor it is likely possible to fulfil most of, if not all, of the condition criteria required for good condition. Despite this it is expected that there would be a certain expectation from the general public of what such an area would look visually, that expectation being "tidy" which is something that precludes any woodland from achieving good condition. The same limitation would have the same result with the grassland beyond preventing it from achieving a higher value grassland such as lowland meadow.

Table 20:Summary values for post-development habitat typologies

Habitat typology	Total Area (Ha)	Habitat scenario for creation	Total Biodiversity units	BU/Ha
Allotments	9.2096	Creation	35.5489	3.86
Castle Park	12.8177	Enhancement/Creation	63.8160	4.9787

3.5.6 A visual representation of Table 20 is also presented as Figure 5.

3.6 Hedgerow Removal

3.6.1 Required hedgerow removal (along with other vegetation removal) is presented on Figure 6. As shown on the plan, the exact locations of sections of hedge removal to facilitate the development is not determined, however it is known that the maximum width of each removal for a road will be 25m and a path / cycleway will be 5m (as stated within the Development Specification). As such, the total required removal is known. There are other removals required to facilitate the proposed development, these are measured from Figure 6. Table 21 below presents the removal required. The locations of the hedgerows referred to in the table can be found on Figure 2. It is assumed that all other hedgerows can be retained.

Table 21: Known hedgerow removal as presented on Figure 5

Hedge	Habitat Type	Other	Road	Path	TOTAL
OT02	NSP+D				0
OT05	NSP+T			5	5
OT06	NSR			5	5

Hedgerow Creation

3.6.2 As a component of the project, there will be multiple types of hedgerow planted throughout the site. As outlined above, at the current planning stage (Tier 1), it is not possible to outline exactly how many hedgerows will be created across the site or where they will be. However, it is possible to utilise the design parameters for the development to estimate a precautionary quantum of delivery of hedgerow within the development. To inform this assessment, two types of hedgerow are estimated:

- Hedgerows within the green open space and landscape buffers, utilised to subdivide development parcels and within green spaces; and
- Hedgerows within the development parcels, delineating gardens and public spaces within the parcels.

3.6.3 The quantum of hedgerow that will be created within category 1 is estimated utilising the GI strategy (ES Appendix 4.11) information. The estimate for the amount of hedgerow within this category is calculated by measuring the likely minimum length of hedgerow required to achieve the goals of the GI Strategy (ES Appendix 4.11), as stated within the 'offsets, transitions and interfaces' requirements (Image 2) and to integrate the roads within the development as outlined in Image 3. This is by nature an estimate but is designed to be precautionary and demonstrates what is likely to be achievable within the development as outlined.

3.6.4 The condition assessment for these hedgerows is targeted to be good. These hedgerows will be within open space and can be manged to provide good habitat value. A demonstration of the targeted good condition is presented in Table 22 and Table 23.

Open Space Typology	Description	Function	Programming	Scale	Benefit
1. Natural or semi-natural open space	Includes: • publicly accessible woodlands • urban forestry • scrub • grasslands (e.g. commons, meadows) • wetlands and wastelands.	• Environmental awareness and education • Wildlife conservation and biodiversity	• Unprogrammed	• Variable	• Habitat creation • Biodiversity • Eco system performance
2. Offset, transition and interface	Includes offsets to existing and proposed hedgerows and woodlands, structure planting, edges and verges	• Screening/softening of built form within wider landscape • Protection of green infrastructure assets • Wildlife conservation and biodiversity	• Tree planting • Informal recreational space • Shrubs and hedges	• Variable widths 5m-30m	• Provides a degree of privacy • Defensible space impacts mental health and wellbeing

Image 2: Excerpt from GI Strategy (ES Appendix 4.11) committing to hedgerow planting in buffer areas

Green Infrastructure Typology	Description	Function	Elements	Scale	Benefit
1. Natural or Semi-Natural Open Space	1a. Hedgerow - field boundaries, property boundaries, highway boundaries	Biodiversity, visual screening, historic field pattern, landscape character, wind break	• Land ownership boundaries • Edges - paths and corridors	Local and Neighbourhood	• Value to nesting birds • Shelter for woodland birds • Shelter for flora and fauna including vertebrates, badgers, hedgehogs, reptiles and amphibians
	1b. Woodland/Copse Ancient Woodland/Scattered Tree Planting	Biodiversity, visual screening, landscape character, shelter, shade, wind break, carbon store	• Woodland planted areas • Woodland Edge Planting • Specimen Tree Planting	Neighbourhood and District	• Value to nesting birds • Shelter for woodland birds • Shelter for flora and fauna including vertebrates, badgers, hedgehogs, reptiles and amphibians
	1c. Grassland	Biodiversity, landscape character	• Agricultural fallow land • Open grassland • Verges and edges	Local, Neighbourhood and District	• Shelter for flora and fauna including vertebrates, badgers, hedgehogs, reptiles and amphibians • Pollinator provision

Image 3: Excerpt from GI Strategy (ES Appendix 4.11) demonstrating commitment to hedge planting along road corridors

Table 22: Estimation of likely condition for hedgerows within the open space

Condition Criteria	Aspect	Requirement	Description	Does the Native Species Rich
A1.	Height	>1.5 m average along length	The average height of woody growth estimated from base of stem to the top of shoots, excluding any bank beneath the hedgerow, any gaps or isolated trees. Newly laid or coppiced hedgerows are indicative of good management and pass this criterion for up to a maximum of four years (if undertaken according to good practice). A newly planted hedgerow does not pass this criterion (unless it is > 1.5 m height).	Yes
A2.	Width	>1.5 m average along length	The average width of woody growth estimated at the widest point of the canopy, excluding gaps and isolated trees. Outgrowths (e.g., blackthorn suckers) are only included in the width estimate when they >0.5 m in height. Laid, coppiced, cut and newly planted hedgerows are indicative of good management and pass this criterion for up to a maximum of four years (if undertaken according to good practice[4]).	Yes
B1.	Gap - hedge base	Gap between ground and base of canopy <0.5 m for >90% of length (unless 'line of trees')	This is the vertical gappiness of the woody component of the hedgerow, and its distance from the ground to the lowest leafy growth. Certain exceptions to this criterion are acceptable (see page 65 of the Hedgerow Survey Handbook).	Yes
B2.	Gap - hedge canopy continuity	· Gaps make up <10% of total length and · No canopy gaps >5 m	This is the horizontal gappiness of the woody component of the hedgerow. Gaps are complete breaks in the woody canopy (no matter how small). Access points and gates contribute to the overall gappiness but are not subject to the >5 m criterion (as this is the typical size of a gate).	Yes

Condition Criteria	Aspect	Requirement	Description	Does the Native Species Rich
C1.	Undisturbed ground and perennial vegetation	>1 m width of undisturbed ground with perennial herbaceous vegetation for >90% of length: · measured from outer edge of hedgerow, and · is present on one side of the hedge (at least)	This is the horizontal gappiness of the woody component of the hedgerow. Gaps are complete breaks in the woody canopy (no matter how small). Access points and gates contribute to the overall gappiness but are not subject to the >5 m criterion (as this is the typical size of a gate).	Yes
C2.	Undesirable perennial vegetation	Plant species indicative of nutrient enrichment of soils dominate <20% cover of the area of undisturbed ground	The indicator species used are nettles (*Urtica* spp.), cleavers (*Galium aparine*) and docks (Rumex spp.). Their presence, either singly or together, should not exceed the 20% cover threshold.	Yes
D1.	Invasive and neophyte species	>90% of the hedgerow and undisturbed ground is free of invasive non-native and neophyte species	Neophytes are plants that have naturalised in the UK since AD 1500. For information on neophytes see the JNCC website and for information on invasive non-native species see the GB Non-Native Secretariat website.	Yes
D2.	Current damage	>90% of the hedgerow or undisturbed ground is free of damage caused by human activities	This criterion addresses damaging activities that may have led to or lead to deterioration in other attributes. This could include evidence of pollution, piles of manure or rubble, or inappropriate management practices (e.g., excessive hedge cutting).	No

Table 23: Condition criteria for attributing a condition to hedgerows

Condition categories for hedgerows without trees		
Category	**Maximum number of attributes that can fail to meet 'favourable condition' criteria in Table TS1-2**	**Weighting (score)**
Good	No more than 2 failures in total; AND No more than 1 in any functional group.	3
Moderate	No more than 4 failures in total; AND Does not fail both attributes in more than one functional group (e.g., fails attributes A1, A2, B1 & C2 = Moderate condition).	2

Condition categories for hedgerows without trees		
Category	**Maximum number of attributes that can fail to meet 'favourable condition' criteria in Table TS1-2**	**Weighting (score)**
Poor	Fails a total of more than 4 attributes; OR Fails both attributes in more than one functional group (e.g., fails attributes A1, A2, B1 & B2 = Poor condition).	1

3.6.5 The second typology is the hedgerow within the development parcels. As shown in Image 6, hedgerows as perimeters are specified within the GI strategy (ES Appendix 4.11) within open spaces and the development parcels. In order to assess a minimum hedgerow provision, an example residential development was utilised to estimate hedgerow provision. This development in Oxfordshire is a residential parcel, comparable in scale to the likely individual parcels within the Otterpool development. However, unlike the Otterpool Park development, this development has no definite commitment to deliver hedgerow, as such this demonstrates a likely minimum hedgerow provision within an Otterpool development parcel. The development analysed is Land to The West Of Mill Lane Marston Oxford Oxfordshire OX3 0QA - application 21/01217/FUL, a residential development of 80 units. An excerpt of the landscape documents is presented as Image 4. Within this example development, for each unit, 3.575 m of native hedgerow (species poor) is proposed (286m for 80 units). As such, utilising this as a worse case example, Otterpool has the potential to deliver approximately 30km of native species poor hedgerow within the development parcels (8500 units X 3.575m = 30.3875km hedge. It is this number that is utilised in the estimates within this assessment.

3.6.6 For the condition of the hedgerows within the development parcels, to account for the limitations inherent to hedgerows within development parcels, a condition of moderate is utilised. The calculation of this estimation is presented in Table 24. An explanation of the scoring is presented in Table 23.

Table 24: Estimation of likely condition for hedgerows within the development parcels

Condition Criteria	Aspect	Requirement	Description	Does the proposed hedgerow meet this requirement?
A1.	Height	>1.5 m average along length	The average height of woody growth estimated from base of stem to the top of shoots, excluding any bank beneath the hedgerow, any gaps or isolated trees. Newly laid or coppiced hedgerows are indicative of good management and pass this criterion for up to a maximum of four years (if undertaken according to good practice). A newly planted hedgerow does not pass this criterion (unless it is > 1.5 m height).	Yes
A2.	Width	>1.5 m average along length	The average width of woody growth estimated at the widest point of the canopy, excluding gaps and isolated trees. Outgrowths (e.g., blackthorn suckers) are only included in the width estimate when they >0.5 m in height. Laid, coppiced, cut and newly planted hedgerows are indicative of good management and pass this criterion for up to a maximum of four years (if undertaken according to good practice[4]).	No
B1.	Gap - hedge base	Gap between ground and base of canopy <0.5 m for >90% of length (unless 'line of trees')	This is the vertical gappiness of the woody component of the hedgerow, and its distance from the ground to the lowest leafy growth. Certain exceptions to this criterion are acceptable (see page 65 of the Hedgerow Survey Handbook).	Yes
B2.	Gap - hedge canopy continuity	· Gaps make up <10% of total length and · No canopy gaps >5 m	This is the horizontal gappiness of the woody component of the hedgerow. Gaps are complete breaks in the woody canopy (no matter how small). Access points and gates contribute to the overall gappiness but are not subject to the >5 m criterion (as this is the typical size of a gate).	No

Condition Criteria	Aspect	Requirement	Description	Does the proposed hedgerow meet this requirement?
C1.	Undisturbed ground and perennial vegetation	>1 m width of undisturbed ground with perennial herbaceous vegetation for >90% of length: · measured from outer edge of hedgerow, and · is present on one side of the hedge (at least)	This is the horizontal gappiness of the woody component of the hedgerow. Gaps are complete breaks in the woody canopy (no matter how small). Access points and gates contribute to the overall gappiness but are not subject to the >5 m criterion (as this is the typical size of a gate).	Yes
C2.	Undesirable perennial vegetation	Plant species indicative of nutrient enrichment of soils dominate <20% cover of the area of undisturbed ground	The indicator species used are nettles (Urtica spp.), cleavers (Galium aparine) and docks (Rumex spp.). Their presence, either singly or together, should not exceed the 20% cover threshold.	No
D1.	Invasive and neophyte species	>90% of the hedgerow and undisturbed ground is free of invasive non-native and neophyte species	Neophytes are plants that have naturalised in the UK since AD 1500. For information on neophytes see the JNCC website and for information on invasive non-native species see the GB Non-Native Secretariat website.	Yes
D2.	Current damage	>90% of the hedgerow or undisturbed ground is free of damage caused by human activities	This criterion addresses damaging activities that may have led to or lead to deterioration in other attributes. This could include evidence of pollution, piles of manure or rubble, or inappropriate management practices (e.g., excessive hedge cutting).	Yes

Image 5: 21/01217/FUL Landscape Strategy Sheet 2

Access

- No more than 20 minutes' walk from all homes
- Hedgerow perimeters take preference to fences
- All publicly accessible green spaces should be accessible to all, accommodating people with disability through innovative design and benefiting from active and passive surveillance

Image 6: Commitment to hedgerow planting in the Key Design Principles (derived from the Green Infrastructure Strategy, ES Appendix 4.11)

3.7 Post-construction Hedgerow Value

3.7.1 There are approximately 12.5 km of hedgerows in the baseline state on site. As a component of the development (as illustrated in the illustrative masterplan and secured within the parameter plans, ES Appendix 4.2), it is assessed that 1.3km of hedgerow will require removal.

3.7.2 Within the construction, extensive hedgerow planting is proposed. A precautionary estimate of the likely hedgerow planting which will be included is made (as this is yet to be fixed) based on an approved residential development (which provides a minimum likely hedgerow provision). This estimates that 31.8km of hedgerow (as a minimum) would be planted within the development. It is assumed that the Native Species rich hedgerow that will be planted will be 'Good' condition and the Native Hedgerow will be of 'Moderate' condition.

3.7.3 Based on these assumptions, this BNG assessment concludes that the development as secured within the parameter plans (ES Appendix 4.2) and as outlined in the Illustrative masterplan 9ES Appendix 4.5) has the potential to deliver 232.75 hedgerow units in the post construction state (from 131.65 units in the baseline state), a total uplift of 76.82%.

3.8 Post-construction River Conditions and Valuation

3.8.1 The proposals include the improvement of the river corridor as part of the development. The proposal includes the following interventions:

- the corridor will be buffered by at least 15m, resulting in more natural riparian habitat, when compared to the often arable dominated habitats currently present in this area.
- Extensive wetland habitats will be created along the river as part of sustainable drainage features. These will include swales, basins, ponds and wetlands (the locations of proposed wetland features are shown in Figure 7 in Chapter 15 Appendix 2).
- Three crossings over the river are proposed, all of which will be clear span structures. Some of the culverts currently present will also be removed as part of the development.

3.8.2 The complete river calculation is presented as Appendix I.

River typology

3.8.3 The river typology is assessed in the same manner as the baseline, i.e., as being 'other rivers and streams'.

River condition

3.8.4 The predicted condition assessment of the reaches is presented in Table 25. The predicted condition indicator scores are presented in Appendix H.

Table 25: Post-development condition assessments

Reach	Condition
East stour reach 1	Fairly good
East stour reach 2	Fairly good
East stour reach 3	Fairly good
East stour tributary reach 1	Fairly good

Strategic significance

3.8.5 The strategic significance of the watercourses is assessed as the same manner as the baseline, i.e., of strategic significance (marked as within local plans).

Encroachment

3.8.6 Due to the buffering of the watercourse by at least 15m along its length, in the current proposals, there is not expected to be significant encroachment into the riparian zone or the channel itself.

Habitat improvement timeframe

3.8.7 It is assumed at this stage that the interventions are not carried out ahead of time, nor is there a delay, relative to the start of the construction process. However, at later stages, when a more detailed construction timeline is available, the calculations will be adjusted to account for any such delays or pre-construction works.

Post-development unit total

3.8.8 As presented in Table 26, the post-development biodiversity unit value of the river habitats is predicted to be 85.19 river units.

Table 26: Post-development river unit totals

River reach	Length (km)	Units
East stour reach 1	1.44	22.97
East stour reach 2	1.28	20.42
East stour reach 3	0.9	14.36
East stour tributary reach 1	1.72	27.44
Total	**5.34**	**85.19**

Biodiversity unit change

3.8.9 There is a potential increase in river units from 73.69 to 85.19. This represents an 11.49 unit and 15.60% increase in river units.

3.9 Changes in Broad Habitat Types

3.9.1 The proposed Development has the potential to result in changes to the amount and quality of the habitats on the site. The UK habitat classification system used within the metric contains a tiered system, grouping similar habitats into “Broad habitats” and more specific “Habitat types”. For example, “Grassland” is a “Broad habitat”, that can contain “Other lowland acid grassland” and “Other neutral grassland”, among others. The area and biodiversity unit changes in these broad habitat types for the proposal are shown in Table 29.

3.9.2 The changes to the areas of the broad habitats present within the site include a decrease in the area of Cropland, Grassland, and Sparsely Vegetated Land habitats, and an increase in the area of Heathland and Shrub, Lakes, Urban, Wetlands, and Woodland and Forest habitats. This is primarily driven by the replacement of the arable cropland (cereal crops) and pasture grassland (modified grassland) that dominates the site with the proposed development areas and the proposed ecological enhancements.

3.9.3 The changes to the biodiversity unit values of the broad habitats present within the site include a complete loss of Cropland and Sparsely Vegetated Land habitats and a minor decrease in the value of Grassland habitats, and a significant increase in the value of Heathland and Shrub, Lakes, Urban, Wetland, and Woodland and Forest habitats. The complete loss of Cropland and Sparsely Vegetated Land habitats results from the replacement of the undesirable ruderal parcels and cereal crops that dominates the site alongside pasture grassland with the proposed Development and proposed ecological enhancements. Given the low value of these parcels, these complete losses can be considered to be sufficiently mitigated as all of the proposed habitats are either of equal low distinctiveness or a higher distinctiveness. Additionally, while there is a loss of grassland, this can also be considered sufficiently mitigated. Over 90% of the grassland present within the baseline is low value modified grassland pasture however in the post-intervention scenario this type of grassland only comprises 33% of the grassland present on the site with the remainder being higher value other neutral grassland or lowland meadow. Therefore,

while there has been a decrease in the overall value of grassland, the coverage on the site of much higher value grassland and other habitats of equal or greater value, has significantly increased.

Table 27: The changes in the total areas in hectares of the broad habitat types

Broad habitat type	Baseline	Post-intervention	Change in area (ha)
Cropland	306.9778	0	-306.9778
Grassland	237.7390	178.7687	-58.9703
Heathland and shrub	3.3436	24.2544	20.9108
Lakes	2.7367	14.7261	11.9894
Sparsely vegetated land	3.8740	0	-3.8740
Urban	29.5176	306.8063	277.2887
Wetlands	0.0000	6.5107	6.5107
Woodland and forest	16.1896	80.3205	64.1310

Table 28: The changes in the total biodiversity unit values of the broad habitat types

Broad habitat type	Baseline	Post-intervention	Change in biodiversity units	% Change in biodiversity units
Cropland	613.9555	0	-613.9555	-100%
Grassland	996.4932	1000.1188	3.6257	0.36%
Heathland and shrub	16.3369	162.3742	146.0373	893.91%
Lakes	47.2614	186.4096	139.1482	294.42%
Sparsely vegetated land	14.4158	0	-14.4158	-100
Urban	132.7050	420.5658	287.8608	216.92%
Wetlands	0.0000	51.2035	51.2035	N/A
Woodland and forest	199.8859	502.4422	302.5564	151.36%

3.10 Summary Results

Area-based habitats

3.10.1 The summary results of the assessments for the outline proposal, using the Biodiversity metric 3.0 calculator are presented in Image 7.

On-site baseline	*Habitat units*	2021.05
	Hedgerow units	0.00
	River units	0.00
On-site post-intervention (Including habitat retention, creation & enhancement)	*Habitat units*	2455.82
	Hedgerow units	0.00
	River units	0.00
On-site net % change (Including habitat retention, creation & enhancement)	*Habitat units*	21.51%
	Hedgerow units	0.00%
	River units	0.00%
Off-site baseline	*Habitat units*	0.00
	Hedgerow units	0.00
	River units	0.00
Off-site post-intervention (Including habitat retention, creation & enhancement)	*Habitat units*	0.00
	Hedgerow units	0.00
	River units	0.00
Total net unit change (including all on-site & off-site habitat retention, creation & enhancement)	*Habitat units*	434.77
	Hedgerow units	0.00
	River units	0.00
Total on-site net % change plus off-site surplus (including all on-site & off-site habitat retention, creation & enhancement)	*Habitat units*	21.51%
	Hedgerow units	0.00%
	River units	0.00%

Image 7: Areas based habitat unit delivery

3.10.2 Under the current outline proposal, the Otterpool Park has the potential to result in an increase in biodiversity units of 434.77, representing a net gain of 21.51%.

3.10.3 The changes in the area and biodiversity units of each broad habitat type for that could result from the outline proposal are shown in Table 29.

3.10.4 The overall increase in biodiversity units is driven by the extensive ecological enhancements and green infrastructure that covers over 50% of the site. A significant portion of the units generated also comes from the recognised value that residential developments can provide for the local ecosystem if they are designed sensitively with the inclusion of natural features such as native trees and shrubs within public amenity space and private gardens, and semi-artificial features such as green roofs and rain gardens. The assumed composition of any one parcel can be found by cross-referencing the parcel ID number labels in the GI strategy (Figure 4) against the relevant entry in the Post Development Land Use Typology Breakdown spreadsheet (Appendix D).

3.10.5 Some of the features that are targeted to be included within the habitat include:

- Ponds created for biodiversity: these will be designed to meet the prescriptions of the relevant ‘habitat of principal importance’ description. Areas where ponds are to be created include the buffer around Harringe Brooks Wood, adjacent to the East Stour River and in the ‘Wildlife Area’ n the northwest of the site.

- Areas of woodland planting: these areas are to be planted to screen the Otterpool park development and to create connectivity. This includes planting linking Harringe Brooks Wood to the river corridor to the north.
- SuDS features including ponds, drainage ditches, swales and rain gardens (these will not primarily be 'for biodiversity' but will have biodiversity value);
- Areas of ditch to be created for water voles;
- Hedgerows will be planted across the development. These will be native species hedges and will be planted to subdivide parcels within the development, but also to provide a permeable barrier for wildlife between properties and GI. These features will provide a notable habitat for a range of species.
- Areas of species rich wildflower grassland will be created across the site. The habitat composition / seed and planting mix should be based upon the soil present but would largely be based upon the descriptions of priority habitat (lowland meadow).
- Scattered trees are to be planted through the GI of the development. The species of these will be designed to safeguard against disease and climate change but will be native where appropriate.
- Areas of scrub will be created/allowed to develop, which will have value for invertebrates and provide a heterogeneous habitat for reptiles.
- Microhabitat features will also be created for a range of receptors, including earth banks and deadwood piles for invertebrates.

3.10.6 The increase is also driven by design principles that follow the mitigation hierarchy such that the highest value habitats are expected to be retained.

Table 29: Changes in area and biodiversity units of broad habitat types

Broad habitat type	Change in area (ha)	Change in biodiversity units	% Change in biodiversity units
Cropland	-306.9778	-613.9555	-100.00%
Grassland	-58.9703	3.6257	0.36%
Heathland and shrub	20.9108	146.0373	893.91%
Lakes	11.9894	139.1482	294.42%
Sparsely vegetated land	-3.8740	-14.4158	-100.00%
Urban	277.2887	287.8608	216.92%
Wetlands	6.5107	51.2035	N/A
Woodland and forest	64.1310	302.5564	151.36%

Hedgerows

3.10.7 The development also has the potential to deliver an uplift in the BU attributable to hedgerows from 131.65 BU to 232.78 BU, or an approximate 75% increase. This uplift is presented in Image 8. This is driven by the retention of hedgerows, inclusion of new hedgerows to subdivide the site and within the built development parcels.

On-site baseline	*Habitat units*	0.00
	Hedgerow units	131.65
	River units	0.00
On-site post-intervention (Including habitat retention, creation & enhancement)	*Habitat units*	0.00
	Hedgerow units	232.78
	River units	0.00
On-site net % change (Including habitat retention, creation & enhancement)	*Habitat units*	0.00%
	Hedgerow units	76.82%
	River units	0.00%
Off-site baseline	*Habitat units*	0.00
	Hedgerow units	0.00
	River units	0.00
Off-site post-intervention (Including habitat retention, creation & enhancement)	*Habitat units*	0.00
	Hedgerow units	0.00
	River units	0.00
Total net unit change (including all on-site & off-site habitat retention, creation & enhancement)	*Habitat units*	0.00
	Hedgerow units	101.13
	River units	0.00
Total on-site net % change plus off-site surplus (including all on-site & off-site habitat retention, creation & enhancement)	*Habitat units*	0.00%
	Hedgerow units	76.82%
	River units	0.00%
Trading rules Satisfied?		**Yes**

Image 8: Delivery of hedgerow units

River habitats

3.10.8 Under current proposals there is potential to deliver an increase in river units from 73.69 to 85.19. This represents an 11.49 and 15.60% increase in river units. This uplift is presented in Image 9. This is largely driven by the buffering of the watercourses on site, leading to a more natural riparian and bank-face area than is currently present in the largely agricultural landscape.

On-site baseline	*Habitat units*	0.00
	Hedgerow units	0.00
	River units	73.69
On-site post-intervention (Including habitat retention, creation & enhancement)	*Habitat units*	0.00
	Hedgerow units	0.00
	River units	85.19
On-site net % change (Including habitat retention, creation & enhancement)	*Habitat units*	0.00%
	Hedgerow units	0.00%
	River units	15.60%
Off-site baseline	*Habitat units*	0.00
	Hedgerow units	0.00
	River units	0.00
Off-site post-intervention (Including habitat retention, creation & enhancement)	*Habitat units*	0.00
	Hedgerow units	0.00
	River units	0.00

Image 9: Delivery of river units

4 Conclusion

4.1.1 This report outlines the biodiversity units of the habitats on site before and the potential units after the proposed development, as defined using the Biodiversity Metric (BM 3.0, issued by Defra and Natural England). In line with the Environment Act (2021), 25 Year Plan for the Environment (HM Government, 2018) and the National Planning Policy Framework (MHCLG, 2019), new development should identify and pursue opportunities for securing measurable net gains for biodiversity and for the wider environment.

4.1.2 The baseline was assessed using data collected for a Preliminary Ecological Appraisal and subsequent updates and condition assessments. The post-development scenario is based on the outline landscape plan and illustrative masterplan in the GI Strategy (ES Appendix 4.11). The proposal has the potential to result in a net gain of 21.51%; a significant net gain for biodiversity that is well above the 10% mandated within the recently passed Environment Act (2021).

4.1.3 On top of a gain evidenced by BM 3.0, the proposal has the potential to increase the coverage of habitats in decline both locally and nationally on previously barren farmland while still able to provide 8500 new residences. It would also play a part in increasing the connectivity between remnant pockets of ancient woodland in the local area. The assessment also identified the potential for 15.6% uplift in river units. The improvements will benefit the watercourse themselves, as well as providing downstream benefits, for example through buffering run-off from adjacent land. The development also has the potential to deliver an uplift in the BU attributable to hedgerows from 131.65 BU to 232.78 BU, or an approximate 75% increase.

4.1.4 As previously stated, this assessment in an indicative scenario that was carried out on an outline proposal for the development, it is not necessarily the way the development will come forward. All the outline parameters of the Development were used, and this report demonstrates that an approximately 20% net gain for biodiversity can achieved under these parameters. However, these parameters may be applied in a different way to design the masterplan and as such, at the later tiers of the planning process, this document will need to be updated and refined.

4.1.5 Update surveys of the baseline status should be carried out and the assessment of the landscape proposals should be further assessed throughout the planning process to ensure the baseline and post-intervention scenarios assessed as accurately as possible.

5 Summary

5.1.1 Arcadis Consulting (UK) Limited has been commissioned on behalf of Otterpool Park LLP to undertake a Biodiversity Net Gain assessment to inform an Environmental Impact Assessment (EIA) for the proposed Development to accompany an amendment to the outline planning application. The proposed Development is 'Otterpool Park', a garden settlement located within Folkestone, Kent.

5.1.2 This report outlines the biodiversity units of the habitats on site before and the potential units after the proposed development, as defined using the Biodiversity Metric (BM 3.0, issued by Defra and Natural England). In line with the 25 Year Plan for the Environment (HM Government, 2018) and the National Planning Policy Framework (MHCLG, 2019), new development should identify and pursue opportunities for securing measurable net gains for biodiversity and for the wider environment.

5.1.3 The baseline was assessed using data collected on the Preliminary Ecological Appraisal and subsequent updates and the post-development scenario is based on the outline landscape plan and GI Strategy (ES Appendix 4.11). The proposal has the potential to result in a net gain of 21.51%; a significant net gain for biodiversity. The assessment also identified the potential for 15.6% uplift in river units and 75% increase in hedgerows.

5.1.4 As the development moves through the stages of the planning process, the landscape design should be refined with input from a suitably qualified ecologist to ensure that each iteration continues to provide at least the net gain in biodiversity outlined in this document, if not more.

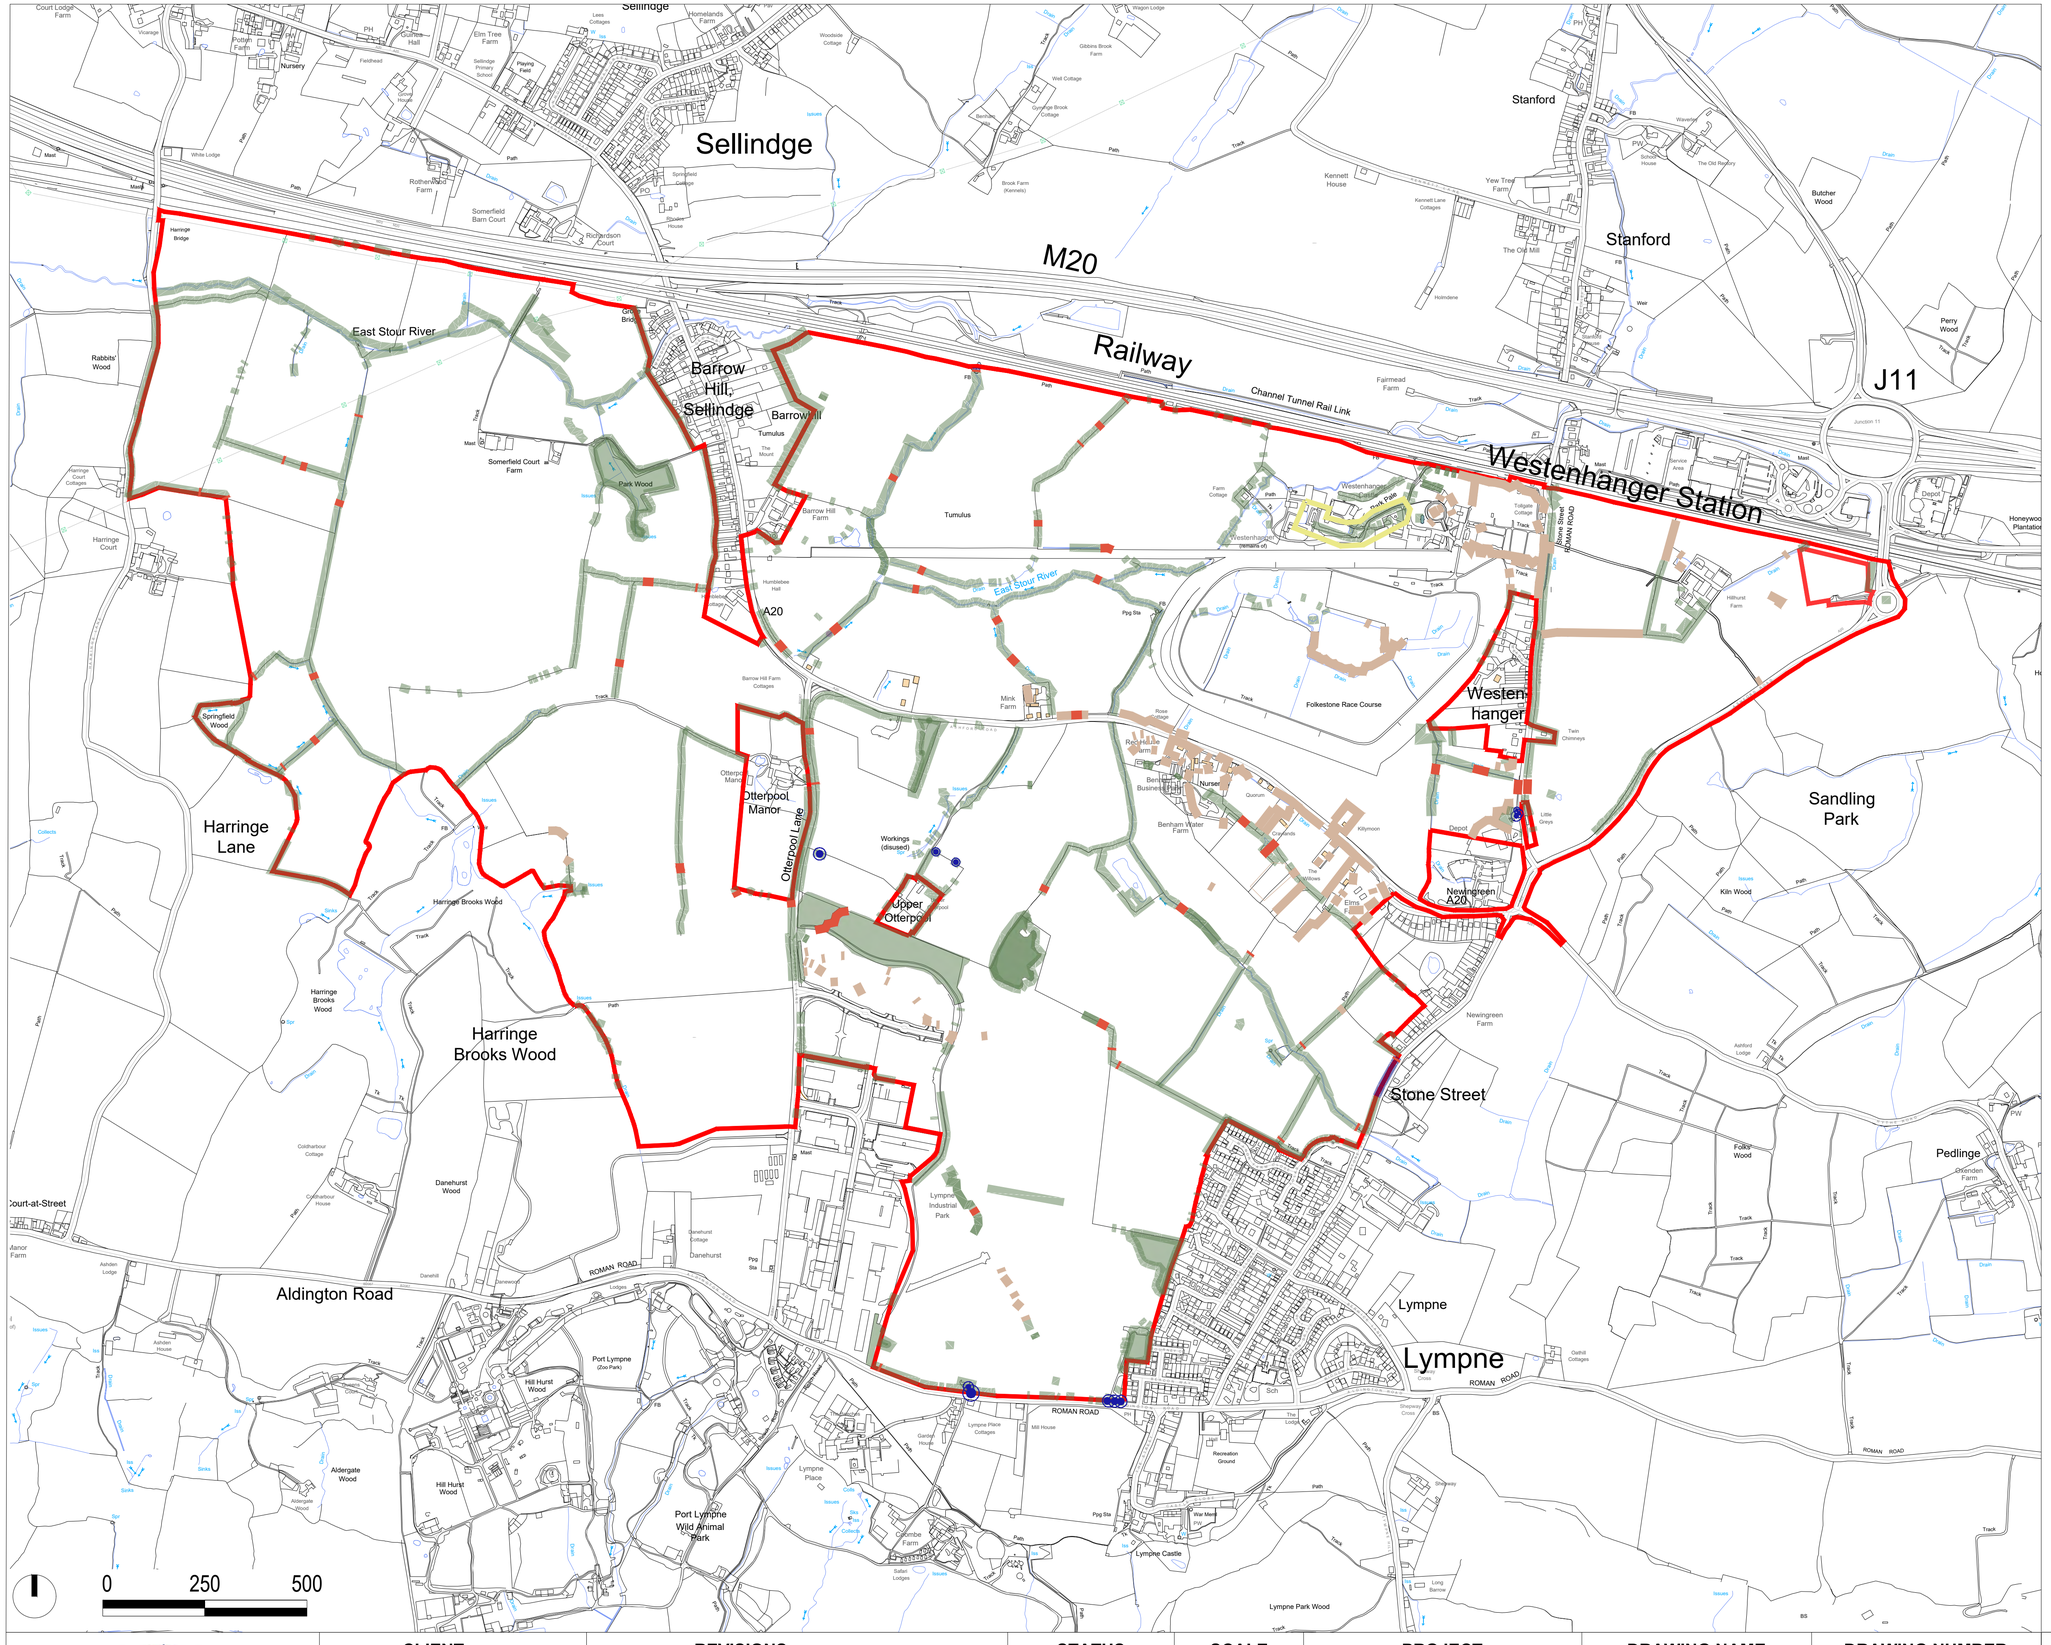
Figure 6: Hedgerow and other vegetation removal

ALL DIMENSIONS, LEVELS, COORDINATES, SETTING OUT, TO BE CHECKED ON SITE AND ANY DISCREPANCY REPORTED IMMEDIATELY TO THE ARCHTECT AND PROJECT MANAGER.



- Existing woodlands, trees, tree belts, hedgerows and vegetation to be retained
- Existing trees with TPO to be retained
- Area in front of Westenhanger Castle with trees and vegetation removal subject to further survey and Conservation Management Plan
- Indicative location of existing trees, hedgerows and vegetation to be removed for movement corridors
- Where parameter plans indicate that movement corridors have possible deviation from the line on the plan, the location and number of the trees to be removed is still subject to later detail design and could be in any location within these limits of deviation.
- Existing woodlands, trees, tree belts, hedgerows and vegetation to be removed
- Application Red Line Boundary

APPENDIX B: Baseline Condition Assessments

Condition Sheet: GRASSLAND Habitat Type (low distinctiveness)			
UKHab Habitat Type(s)			
Grassland - Modified grassland			
Habitat Description			
See UKHab			
Condition Assessment Criteria		**All amenity grassland**	**All improved grassland**
1	There must be 6-8 species per m^2. Note - if a grassland has 9 or more species per m^2 it should be classified as	0	0
2	Sward height is varied (at least 20% of the sward is less than 7 cm and at least 20 per cent is more than 7 cm) creating microclimates which provide	0	0
3	Some scattered scrub (including bramble) may be present, but scrub accounts for less than 20% of total grassland area. Note - patches of shrubs with	1	1
4	Physical damage evident in less than 5% of total grassland area, such as excessive poaching, damage from machinery use or storage, damaging levels of	1	1
5	Cover of bare ground between 1% and 5%, including localised areas, for example, rabbit warrens.	0	0
6	Cover of bracken less than 20%.	1	1
7	There is an absence of invasive non-native species (as listed on Schedule 9 of WCA, 1981) and undesirable species[1] make up less than 5% of ground cover.	1	1
ndition Assessment Res	**Condition Assessment Score**	4	4
criteria including non-	Good (3)		
criteria; OR	Moderate (2)	y	y
Passes 0, 1, 2 or 3 of 7 criteria	Poor (1)		
Notes			
include: Creeping thistle *Cirsium arvense* , spear thistle *Cirsium*			

Condition Sheet: GRASSLAND Habitat Type (medium, high & very high distinctiveness)				
UKHab Habitat Type(s)				
~~Grassland - Lowland calcareous grassland~~ ~~Grassland - Lowland dry acid grassland~~				
Habitat Description				
See UKHab * Note Tall herb habitat that does not meet the definition of Annex 1 habitat "Tall herb communities (H6430)" should be recorded as "Other neutral grassland"				
Condition Assessment Criteria		**360**	**361**	**581**
1	The appearance and composition of the vegetation closely matches characteristics of the specific grassland habitat type (see UKHab definition). Wildflowers, sedges and indicator species for the specific grassland habitat type are very clearly and easily visible throughout the sward.	0	0	0
2	Sward height is varied (at least 20% of the sward is less than 7 cm and at least 20 per cent is more than 7 cm) creating microclimates which provide opportunities for insects, birds and small mammals to live and breed.	1	1	1
3	Cover of bare ground between 1% and 5%, including localised areas, for example, rabbit warrens.	1	1	1
4	Cover of bracken less than 20% and cover of scrub (including bramble) less than 5%.	1	1	1
5	There is an absence of invasive non-native species (as listed on Schedule 9 of WCA, 1981). Combined cover of undesirable species[1] and physical damage (such as excessive poaching, damage from machinery use or storage, damaging levels of access, or any other damaging management activities) accounts for less than 5% of total area.	0	0	0
Condition Assessment Result	**Condition Assessment Score**	**3**	**3**	**3**
Passes 5 of 5 criteria	Good (3)			
Passes 3 or 4 of 5 criteria	Moderate (2)	Y	Y	Y
Passes 0, 1 or 2 of 5 criteria	Poor (1)			
Notes				
Footnote 1 - Species considered undesirable for this habitat type include: Creeping thistle *Cirsium arvense* , spear thistle *Cirsium vulgare* , curled dock *Rumex crispus* , broad-leaved dock *Rumex obtusifolius* , common nettle *Urtica dioica* , creeping buttercup *Ranunculus repens* , greater plantain *Plantago major* , white clover *Trifolium repens* , cow parsley *Anthriscus sylvestris.*				

Condition Sheet: GRASSLAND Habitat Type (low distinctiveness)								
UKHab Habitat Type(s)								
Grassland - Modified grassland								
Habitat Description								
See UKHab								
Condition Assessment Criteria			**29**	**147**	**365**	**367**	**531**	**578**
1	There must be 6-8 species per m^2. Note - if a grassland has 9 or more species per m^2 it should be classified as a moderate distinctiveness grassland habitat type. **NB - this criterion is non-negotiable for achieving good condition.**		0	1	0	0	0	0
2	Sward height is varied (at least 20% of the sward is less than 7 cm and at least 20 per cent is more than 7 cm) creating microclimates which provide opportunities for insects, birds and small mammals to live and breed.		1	0	1	1	0	0
3	Some scattered scrub (including bramble) may be present, but scrub accounts for less than 20% of total grassland area. Note - patches of shrubs with continuous (more than 90%) cover should be classified as the relevant scrub habitat type.		1	1	1	1	1	1
4	Physical damage evident in less than 5% of total grassland area, such as excessive poaching, damage from machinery use or storage, damaging levels of access, or any other damaging management activities.		1	0	1	1	1	1
5	Cover of bare ground between 1% and 5%, including localised areas, for example, rabbit warrens.		1	1	1	1	1	1
6	Cover of bracken less than 20%.		1	1	1	1	1	1
7	There is an absence of invasive non-native species (as listed on Schedule 9 of WCA, 1981) and undesirable species[1] make up less than 5% of ground cover.		1	1	1	1	1	1
Condition Assessment Result		**Condition Assessment Score**	**6**	**5**	**6**	**6**	**5**	**5**

1	There must be 6-8 species per m^2. Note - if a grassland has 9 or more species per m^2 it should be classified as a moderate distinctiveness grassland habitat type. **NB - this criterion is non-negotiable for achieving good condition.**	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0									
2	Sward height is varied (at least 20% of the sward is less than 7 cm and at least 20 per cent is more than 7 cm) creating microclimates which provide opportunities for insects, birds and small mammals to live and breed.	0	0	0	1	0	1	1	1	1	0	0	0	0	0	0	1	0	0	0									
3	Some scattered scrub (including bramble) may be present, but scrub accounts for less than 20% of total grassland area. Note - patches of shrubs with continuous (more than 90%) cover should be classified as the relevant scrub habitat type.	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1									
4	Physical damage evident in less than 5% of total grassland area, such as excessive poaching, damage from machinery use or storage, damaging levels of access, or any other damaging management activities.	1	0	1	1	0	1	1	1	1	1	1	1	1	0	1	0	0	1	1									
5	Cover of bare ground between 1% and 5%, including localised areas, for example, rabbit warrens.	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	0	1	1	1									
6	Cover of bracken less than 20%.	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1									
7	There is an absence of invasive non-native species (as listed on Schedule 9 of WCA, 1981) and undesirable species[1] make up less than 5% of ground cover.	0	1	0	1	1	0	0	0	0	1	1	0	0	1	1	1	1	1	1									
Condition Assessment Result	**Condition Assessment Score**	**4**	**4**	**4**	**6**	**4**	**5**	**5**	**5**	**5**	**5**	**5**	**4**	**4**	**4**	**5**	**4**	**4**	**5**	**5**	**0**	**0**	**0**	**0**	**0**	**0**	**0**		
Passes 6 or 7 of 7 criteria including non-negotiable criterion 7	Good (3)																												
Passes 6 of 7 criteria excluding non-negotiable criterion 7	Moderate (2)	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y									
Passes 0, 1, 2 or 3 of 7 criteria	Poor (1)																												
Notes																													
Footnote 1 - Species considered undesirable for this habitat type include: Creeping thistle *Cirsium arvense* , spear thistle *Cirsium vulgare* , curled dock *Rumex crispus* , broad-leaved dock *Rumex obtusifolius* , common nettle *Urtica dioica* , greater plantain Plantago major, white clover *Trifolium repens* , cow parsley *Anthriscus sylvestris* .																													

Condition Sheet: POND Habitat Type

UKHab Habitat Type(s)

Lakes - Ponds (priority habitat)
Lakes - Ponds (non-priority habitat)
Lakes - Temporary lakes, ponds and pools [Use this condition sheet for Temporary ponds and pools, use Lake condition sheet for Temporary lakes]
Lakes - Ornamental lake or pond [Use this condition sheet for Ornamental ponds, use Lake condition sheet for Ornamental lakes]

Habitat Description

See UKHab
other than for non-priority ponds, which are those which do not meet either the definition of (i) priority habitat ponds or (ii) ornamental ponds

Condition Assessment Criteria

	applicable to all ponds	**23)**	**84 (9)**	**161 (16)**	**164 (17)**	**174 (18)**	**185 (14)**	**339 (15a)**	**340 (15a)**	**382 (22)**	**389 (23)**	**417 (24)**	**460 (19)**	**462 (21a)**	**463 (20)**	**486 (26)**	**489 (25)**	**439 (27)**	**519 (28)**	**542 (4)**
1	The pond is of good water quality, with clear water (low turbidity) indicating no obvious signs of pollution. Turbidity is acceptable if the pond is grazed by livestock.	1	1	1	1	1	1	1	1	1	1	1	1	1	1	0	0	1	0	1
2	There is semi-natural habitat (i.e. moderate distinctiveness or above) for at least 10 m from the pond edge.	0	1	1	1	0	0	1	1	0	0	0	1	0	0	0	0	1	0	0
3	Less than 10% of the pond is covered with duckweed or filamentous algae.	1	1	1	0	0	1	1	1	0	0	1	1	1	1	1	1	1	1	1
4	The pond is not artificially connected to other waterbodies, either via streams, ditches or artificial pipework.	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
5	Pond water levels should be able to fluctuate naturally throughout the year. No obvious dams, pumps or pipework.	1	1	1	1	1	1	1	1	1	1	0	1	1	1	1	1	1	1	1
6	There is an absence of non-native plant and animal species[2].	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	0	1	1
7	The pond is not artificially stocked with fish. If the pond naturally contains fish, it is a native fish assemblage at low densities.	1	1	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
	ADDITIONAL CRITERIA - only applicable to non-woodland ponds:																			
8	In non-woodland ponds, plants, be they emergent, submerged or floating (excluding duckweeds)[3], should cover at least 50% of the pond area that is less than 3 m deep.	0	1	0	0	0	1	0	0	0	0	0	1	0	0	0	0	0	0	0
9	The surface of non-woodland ponds is no more than 50% shaded by woody bankside species.	1	1	1	1	1	1	1	1	0	0	1	1	1	1	1	1	1	0	1
Condition Assessment Result	**Condition Assessment Score**																			
If 8 criteria assessed (woodland ponds):		7	9	7	7	6	8	8	8	5	5	6	9	7	7	6	6	7	5	7
Passes 7 of 7 criteria	Good (3)		Y										Y							
Passes 5 or 6 of 7 criteria	Moderate (2)	Y		Y	Y	Y	Y	Y	Y			Y		Y	Y	Y	Y	Y		Y
Passes 0, 1, 2, 3 or 4 of 7 criteria	Poor (1)									Y	Y								Y	
If 10 criteria assessed (non-woodland ponds):																				
Passes 9 of 9 criteria	Good (3)																			
Passes 6, 7 or 8 of 9	Moderate (2)																			
Passes 0, 1, 2, 3, 4 or 5 of 9 criteria	Poor (1)																			

Footnote 1 - A woodland pond will be surrounded on all sides by woodland habitat.

Footnote 2 - Any species included on the Water Framework Directive UKTAG GB High Impact Species List should be absent.

• Frequently occurring non-native plant species include water fern *Azolla spp.,* Australian swamp stonecrop *Crassula helmsii* , parrot's feather *Myriophyllum aquaticum* , floating pennywort *Hydrocotyle ranunculoides* and Japanese knotweed *Fallopia japonica,* giant hogweed *Heracleum mantegazzianum* (on the bank).
• Frequently occurring non-native animals include signal crayfish *Pacifastacus leniusculus* , zebra mussels *Dreissena polymorpha* , killer shrimp *Dikerogammarus villosus* , demon shrimp *Dikerogammarus haemobaphes,* carp *Cyprinus carpio* .

Footnote 3 - If the pond is seasonal (i.e. dries out in most summers) then emergent species alone are likely to be found.

Condition Sheet: SCRUB Habitat Type																																			
UKHab Habitat Type																																				
Heathland and shrub - Blackthorn scrub																																				
Habitat Description																																				
See UKHab																																				
For sea buckthorn scrub use Habitats Directive Annex 1 definition																																				
Condition Assessment Criteria		**9**	**31**	**48**	**56**	**65**	**80**	**113**	**244**	**288**	**297**	**299**	**319**	**337**	**348**	**383**	**454**	**461**	**464**	**520**	**567**	**567**	**644**	**645**	**646**	**647**	**648**	**649**	**650**	**651**	**652**	**669**	**670**	**676**
1	Habitat is representative of UKHab description (where in its natural range). There are at least three woody species, with no one species comprising more than 75% of the cover (except common juniper, sea buckthorn or box, which can be up to 100% cover).	1	1	1	0	1	0	0	0	1	0	1	0	0	1	0	1	1	1	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1
2	There is a good age range – all of the following are present: seedlings, young shrubs and mature shrubs.	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Footnote 1 - Species considered undesirable for this habitat type include: creeping thistle *Cirsium arvense* , common nettle *Urtica dioica* , cherry laurel *Prunus laurocerasus* , snowberry *Symphoricarpos* spp., buddleia *Buddleja* spp., cotoneaster *Cotoneaster* spp., Spanish bluebell *Hyacinthoides hispanica* (or hybrids).																																			

Condition Sheet: URBAN - NON PRIORITY Habitat Type					
UKHab Habitat Type					
Sparsely vegetated land - Ruderal/ephemeral					
Habitat Description					
See UKHab					
Condition Assessment Criteria					
CORE CRITERIA - applicable to **all urban habitat types:**			**628**	**629**	**630**
1	Vegetation structure is varied, providing opportunities for insects, birds and bats to live and breed. A single ecotone (i.e. scrub, grassland, herbs) should not account for more than 80% of the total habitat area.		0	0	0
2	There is a diverse range of flowering plant species, providing nectar sources for insects. These species may be either native, or non-native but beneficial to wildlife. NB - To achieve GOOD condition, criterion 2 must be satisfied by native species only (rather than non-natives beneficial to wildlife).		1	1	1
3	Invasive non-native species (Schedule 9 of WCA) cover less than 5% of total vegetated area. NB - To achieve GOOD condition, criterion 3 must be satisfied by a complete absence of invasive non-native species (rather than <5% cover).		0	0	0
ADDITIONAL CRITERION - only applicable to **Open mosaic on previously developed land** habitat type:					
4a	The site shows spatial variation, forming a mosaic of at least four early successional communities (a) to (f) PLUS bare substrate AND pools. (a) annuals; (b) mosses/liverworts; (c) lichens; (d) ruderals; (e) inundation				
ADDITIONAL CRITERION - only applicable to **Bioswale and SUDS** habitat types:					
4b	The water table is at or near the surface throughout the year. This could be open water or saturation of soil at the surface				
Condition Assessment Result		**Condition Assessment Score**			
If 3 criteria assessed:					
• Passes 3 of 3 core criteria; AND • Meets the requirements for good condition within criteria 2 and 3		Good (3)			
• Passes 2 of 3 core criteria; OR • Passes 3 of 3 core criteria but does not meet the requirements for good condition within criteria 2 and 3		Moderate (2)			
• Passes 0 or 1 of 3 core criteria		Poor (1)	Y	Y	Y
If 4 criteria assessed:					
• Passes 3 of 3 core criteria, AND • Meets the requirements for good condition within criteria 2 and 3; AND		Good (3)			
• Passes 2 of 3 or 4 criteria, OR • Passes 4 of 4 criteria but does not meet the requirements for good		Moderate (2)			
• Passes 0 or 1 of 4 criteria		Poor (1)			
Notes					

Condition Sheet: URBAN - NON PRIORITY Habitat Type		
UKHab Habitat Type		
Sparsely vegetated land - Ruderal/ephemeral		
Habitat Description		
See UKHab		
Condition Assessment Criteria		
CORE CRITERIA - applicable to **all urban habitat types:**		**All tall ruderal**
1	Vegetation structure is varied, providing opportunities for insects, birds and bats to live and breed. A single ecotone (i.e. scrub, grassland, herbs) should not account for more than 80% of the total habitat area.	1
2	There is a diverse range of flowering plant species, providing nectar sources for insects. These species may be either native, or non-native but beneficial to wildlife. NB - To achieve GOOD condition, criterion 2 must be satisfied by native species only (rather than non-natives beneficial to wildlife).	0
3	Invasive non-native species (Schedule 9 of WCA) cover less than 5% of total vegetated area. NB - To achieve GOOD condition, criterion 3 must be satisfied by a complete absence of invasive non-native species (rather than <5% cover).	1
ADDITIONAL CRITERION - only applicable to **Open mosaic on previously developed land** habitat type:		
4a	The site shows spatial variation, forming a mosaic of at least four early successional communities (a) to (h) PLUS bare substrate AND pools. (a) annuals; (b) mosses/liverworts; (c) lichens; (d) ruderals; (e) inundation species; (f) open grassland; (g) flower-rich grassland; (h) heathland.	
ADDITIONAL CRITERION - only applicable to **Bioswale and SUDS** habitat types:		
4b	The water table is at or near the surface throughout the year. This could be open water or saturation of soil at the surface.	

Condition Assessment Result	Condition Assessment Score	
If 3 criteria assessed:		2
• Passes 3 of 3 core criteria; AND • Meets the requirements for good condition within criteria 2 and 3	Good (3)	
• Passes 2 of 3 core criteria; OR • Passes 3 of 3 core criteria but does not meet the requirements for good condition within criteria 2 and 3	Moderate (2)	Y

Condition Sheet: WOODLAND Habitat Type

UKHab Habitat Type(s)

Woodland and forest - Lowland beech and yew woodland

Habitat Description

See UKHab

Condition Assessment Criteria

	Indicator	Good (3 points)	Moderate (2 points)	Poor (1 point)	6	7	61	391	525
1	**Age distribution of trees**[1]	Three age classes present	Two age classes present	One age class present	1	1	1	1	1
2	**Wild, domestic and feral herbivore damage**	No significant browsing damage evident in woodland[2]	Evidence of significant browsing pressure is present in 40% or less of whole woodland	Evidence of significant browsing pressure is present in 40% or more of whole woodland	3	3	3	3	3
3	**Invasive plant species**[3]	No invasive species present in woodland	Rhododendron or laurel not present, other invasive species < 10% cover	Rhododendron or laurel present, or other invasive species > 10% cover	3	3	3	3	3
4	**Number of native tree species**	Five or more native tree or shrub species found across woodland parcel	Three to four native tree or shrub species found across woodland parcel	None to two native tree or shrub species across woodland parcel	3	3	2	1	2
5	**Cover of native tree and shrub species**	> 80% of canopy trees and >80% of understory shrubs are native	50-80% of canopy trees and 50-80% of understory shrubs are native	< 50% of canopy trees and <50% of understory shrubs are native	3	3	3	3	3
6	**Open space within woodland**[4]	10 – 20% of woodland has areas of temporary open space, unless woodland is <10ha in which case lower threshold of 10% does not apply	21- 40% of woodland has areas of temporary open space	More than 40% of woodland has areas of temporary open space	2	2	2	1	1
7	**Woodland regeneration**[5]	All three classes present in woodland; trees 4-7cm dbh, saplings and seedlings or advanced coppice regrowth	One or two classes only present in woodland	No classes or coppice regrowth present in woodland	2	2	2	1	1
8	**Tree health**	Tree mortality less than 10%, no pests or diseases and no crown dieback	11% to 25% mortality and/or crown dieback or low risk pest or disease present	Greater than 25% tree mortality and or any high risk pest or disease present	3	3	3	3	3
9	**Vegetation and ground flora**	Ancient woodland flora indicators present	Recognisable NVC plant community present	No recognisable NVC community					
10	**Woodland vertical structure**[6]	Three or more storeys across all survey plots or a complex woodland	Two storeys across all survey plots	One or less storey across all survey plots	1	1	1	1	1
11	**Veteran trees**[7]	Two or more veteran trees per hectare	One veteran tree per hectare	No veteran trees present in woodland	1	1	1	1	1
12	**Amount of deadwood**	50% of all survey plots within the woodland parcel have standing deadwood, large dead branches/ stems and stumps	Between 25% and 50% of all survey plots within the woodland parcel have standing deadwood, large dead branches/ stems and stumps	Less than 25% of all survey plots within the woodland parcel have standing deadwood, large dead branches/ stems and stumps	1	1	1	1	1
13	**Woodland disturbance**[8]	No nutrient enrichment or damaged ground evident	Less than 1 hectare in total of nutrient enrichment across woodland area and/or less than 20% of woodland area has damaged ground	More than 1 hectare of nutrient enrichment and/or more than 20% of woodland area has damaged ground	3	3	3	2	3
				Total score (out of a possible 39)	**26**	**26**	**25**	**21**	**23**

Condition Assessment Result	Condition Assessment Score					
Total score >32 (33 to 39)	Good (3)					
Total score 26 to 32	Moderate (2)	Y				
Total score <26 (13 to 25)	Poor (1)					

Notes

Footnote 1 - See EWBG method INDICATOR 1 for more information. If tree species is not a birch, cherry or Sorbus: 0 – 20 years (Young); 21 - 150 years (Intermediate); and >150 years (Old). A recognisable age class should be a consistent recognisable layer across the woodland or stand being assessed. Presence of a few saplings would not indicate that the woodland has an 'age class' of young trees.

Footnote 2 - See EWBG method INDICATOR 2 for more information. Browsing pressure is considered to be significant where >20% of vegetation visible within each survey plot shows damage from any type of browsing pressure listed.

Footnote 3 - See EWBG method INDICATOR 3 for more information. Check for presence of the following invasive non-native species: American skunk cabbage *Lysichiton americanus;* Himalayan balsam *Impatiens glandulifera;* Japanese knotweed *Fallopia japonica;* Cherry Laurel *Prunus laurocerasus;* Shallon *Gaultheria shallon;* Snowberry *Symphoricarpos albus;* Variegated yellow archangel *Lamiastrum galeobdolon subsp. argentatum;* and Rhododendron *Rhododendron ponticum.*

Footnote 4 - See EWBG method INDICATOR 6 for more information. Open space within woodland in this context is temporary open space in which trees can be expected to regenerate (e.g. glades, rides, footpaths, areas of clear-fell). This differs from permanent open space where tree regeneration is not possible or desirable (e.g. tarmac, buildings, rivers). Area is at least 10m wide with less than 20% covered by shrubs or trees.

Footnote 5 - See EWBG method INDICATOR 8 for more information. This indicator measures regeneration potential of the woodland by considering three classes: seedlings; saplings; and young trees of 4-7 cm DBH. All three classes would fall in the 'young' category of the 'age distribution of trees' indicator, the regeneration indicator is gathers additional information by considering regeneration potential i.e. if seedlings, saplings and young trees are all present that means natural regeneration processes are happening.

Footnote 6 - This indicator is looking at structural diversity and is useful to understand in conjunction with the age of trees in a woodland. Vertical structure is defined as the number of canopy storeys present. Possible storey values are: 1) Upper; 2) Complex: recorded when the stand is composed of multiple tree heights that cannot easily be stratified into broad height bands (such as upper, middle or lower); 3) Middle; 4) Lower; and 5) Shrub layer.

Footnote 7- See EWBG method INDICATOR 12 for more information. All ancient trees are veteran trees, but not all veteran trees are ancient. A veteran tree may not be very old, but it has decay features, such as branch death and hollowing. These features contribute to its biodiversity, cultural and heritage value. Veteran trees can be classified if they have four out of the five following features:

1. Rot sites associated with wounds which are decaying >400 cm^2;
2. Holes and water pockets in the trunk and mature crown >5 cm diameter;
3. Dead branches or stems >15 cm diameter;
4. Any hollowing in the trunk or major limbs;
5. Fruit bodies of fungi known to cause wood decay.

Footnote 8 - See EWBG method INDICATOR 15 for more information. Examples of disturbance are: significant nutrient enrichment; soil compaction from trampling, machinery or animal poaching; litter.

Condition Assessment Criteria

Indicator		Good (3 points)	Moderate (2 points)	Poor (1 point)	26	146
1	**Age distribution of trees**[1]	Three age classes present	Two age classes present	One age class present	1	1
2	**Wild, domestic and feral herbivore damage**	No significant browsing damage evident in woodland[2]	Evidence of significant browsing pressure is present in 40% or less of whole woodland	Evidence of significant browsing pressure is present in 40% or more of whole woodland	3	3
3	**Invasive plant species**[3]	No invasive species present in woodland	Rhododendron or laurel not present, other invasive species < 10% cover	Rhododendron or laurel present, or other invasive species > 10% cover	3	3
4	**Number of native tree species**	Five or more native tree or shrub species found across woodland parcel	Three to four native tree or shrub species found across woodland parcel	None to two native tree or shrub species across woodland parcel	3	3
5	**Cover of native tree and shrub species**	> 80% of canopy trees and >80% of understory shrubs are native	50-80% of canopy trees and 50-80% of understory shrubs are native	< 50% of canopy trees and <50% of understory shrubs are native	3	3
6	**Open space within woodland**[4]	10 – 20% of woodland has areas of temporary open space, unless woodland is <10ha in which case lower threshold of 10% does not apply	21- 40% of woodland has areas of temporary open space	More than 40% of woodland has areas of temporary open space	3	3
7	**Woodland regeneration**[5]	All three classes present in woodland; trees 4-7cm dbh, saplings and seedlings or advanced coppice regrowth	One or two classes only present in woodland	No classes or coppice regrowth present in woodland	2	2
8	**Tree health**	Tree mortality less than 10%, no pests or diseases and no crown dieback	11% to 25% mortality and/or crown dieback or low risk pest or disease present	Greater than 25% tree mortality and or any high risk pest or disease present	3	3
9	**Vegetation and ground flora**	Ancient woodland flora indicators present	Recognisable NVC plant community present	No recognisable NVC community	1	1
10	**Woodland vertical structure**[6]	Three or more storeys across all survey plots or a complex woodland	Two storeys across all survey plots	One or less storey across all survey plots	1	1
11	**Veteran trees**[7]	Two or more veteran trees per hectare	One veteran tree per hectare	No veteran trees present in woodland	1	1
12	**Amount of deadwood**	50% of all survey plots within the woodland parcel have standing deadwood, large dead branches/ stems and stumps	Between 25% and 50% of all survey plots within the woodland parcel have standing deadwood, large dead branches/ stems and stumps	Less than 25% of all survey plots within the woodland parcel have standing deadwood, large dead branches/ stems and stumps	1	1
13	**Woodland disturbance**[8]	No nutrient enrichment or damaged ground evident	Less than 1 hectare in total of nutrient enrichment across woodland area and/or less than 20% of woodland area has damaged ground	More than 1 hectare of nutrient enrichment and/or more than 20% of woodland area has damaged ground	2	2
				Total score (out of a possible 39)	**27**	**27**

Condition Assessment Result	Condition Assessment Score
Total score >32 (33 to 39)	Good (3)
Total score 26 to 32	Moderate (2)
Total score <26 (13 to 25)	Poor (1)

Notes

Footnote 1 - See EWBG method INDICATOR 1 for more information. If tree species is not a birch, cherry or Sorbus: 0 – 20 years (Young); 21 - 150 years (Intermediate); and >150 years (Old). A recognisable age class should be a consistent recognisable layer across the woodland or stand being assessed. Presence of a few saplings would not indicate that the woodland has an 'age class' of young trees.

Footnote 2 - See EWBG method INDICATOR 2 for more information. Browsing pressure is considered to be significant where >20% of vegetation visible within each survey plot shows damage from any type of browsing pressure listed.

Footnote 3 - See EWBG method INDICATOR 3 for more information. Check for presence of the following invasive non-native species: American skunk cabbage *Lysichiton americanus;* Himalayan balsam *Impatiens glandulifera;* Japanese knotweed *Fallopia japonica;* Cherry Laurel *Prunus lauroceraus;* Shallon *Gaultheria shallon;* Snowberry *Symphoricarpos albus;* Variegated yellow archangel *Lamiastrum galeobdolon subsp. argentatum;* and Rhododendron *Rhododendron ponticum.*

Footnote 4 - See EWBG method INDICATOR 6 for more information. Open space within woodland in this context is temporary open space in which trees can be expected to regenerate (e.g. glades, rides, footpaths, areas of clear-fell). This differs from permanent open space where tree regeneration is not possible or desirable (e.g. tarmac, buildings, rivers). Area is at least 10m wide with less than 20% covered by shrubs or trees.

Footnote 5 - See EWBG method INDICATOR 8 for more information. This indicator measures regeneration potential of the woodland by considering three classes: seedlings; saplings; and young trees of 4-7 cm DBH. All three classes would fall in the 'young' category of the 'age distribution of trees' indicator, the regeneration indicator is gathers additional information by considering regeneration potential i.e. if seedlings, saplings and young trees are all present that means natural regeneration processes are happening.

Footnote 6 - This indicator is looking at structural diversity and is useful to understand in conjunction with the age of trees in a woodland. Vertical structure is defined as the number of canopy storeys present. Possible storey values are: 1) Upper; 2) Complex: recorded when the stand is composed of multiple tree heights that cannot easily be stratified into broad height bands (such as upper, middle or lower); 3) Middle; 4) Lower; and 5) Shrub layer.

Footnote 7- See EWBG method INDICATOR 12 for more information. All ancient trees are veteran trees, but not all veteran trees are ancient. A veteran tree may not be very old, but it has decay features, such as branch death and hollowing. These features contribute to its biodiversity, cultural and heritage value. Veteran trees can be classified if they have four out of the five following features:

1. Rot sites associated with wounds which are decaying >400 cm^2;
2. Holes and water pockets in the trunk and mature crown >5 cm diameter;

Condition Sheet: WOOD-PASTURE & PARKLAND Habitat Type					
UKHab Habitat Type(s)					
Woodland and forest - Wood-pasture and parkland					
Habitat Description					
See UKHab					
Condition Assessment Criteria		**3**	**37**	**180**	**409**
1	Presence of ancient[1] and / or veteran[2] trees.	0	0	0	0
2	Trees are of a range of different ages to ensure replacement. Three age classes are present and must include at least one of the following: mature[3], late-mature[3], ancient or veteran trees.	0	0	0	0
3	Presence of standing and / or fallen deadwood: • Wood-pasture - All ancient and veteran trees have standing deadwood, large dead branches, stems and stumps associated with them. • Parkland - 80% of ancient and veteran trees have standing deadwood, large dead branches, stems and stumps associated with them.	0	0	0	0
4	There is little or no evidence of an adverse impact on tree health by anthropogenic activities, livestock or wild animals, or pests or diseases (e.g. no evidence of poaching, nettles, ground compaction, bare ground under trees or grazing damage to bark and roots).	1	1	1	1
5	Ground cover comprises semi-natural grassland or heathland.	0	0	0	0
6	Grassland or heathland habitat is subject to an appropriate management regime: • Grassland - Sward height is varied (at least 20% of the sward is less than 7 cm and at least 20 per cent is more than 7 cm) creating microclimates which provide opportunities for insects, birds and small mammals to live and breed. • Heathland - There is a range of age classes of heather present, with the following proportions: pioneer heather 10-40%, building/mature heather 20-80%, degenerate heather <30% and dead heather <10%.	0	0	0	0

Condition Assessment Result	Condition Assessment Score	1	1	1	1
Passes 6 of 6 criteria	Good (3)				
Passes 4 or 5 of 6 criteria	Moderate (2)				
Passes 0, 1, 2 or 3 of 6 criteria	Poor (1)	Y	Y	Y	Y

Notes

Footnote 1 - Ancient trees are exceptionally valuable. Attributes can include: its great age in comparison with other trees of the same species; size, especially very wide trunk; condition; biodiversity value as a result of significant wood decay and the habitat created from the ageing process; and cultural and heritage value. Very few trees of any species become ancient.
Ancient trees can be classified using the following girth guide at 1.5 m from the ground:

- >2.5 m for field maple, rowan, yew, birch, holly and other smaller tree species;
- >4 m for oaks, ash, Scot's pine, alder;
- >4.5 m for sycamore, lime, horse chestnut, sweet chestnut, elm species, poplar species, beech, willows, other pines and exotics.

Footnote 2 - All ancient trees are veteran trees, but not all veteran trees are ancient. A veteran tree may not be very old, but it has decay features, such as branch death and hollowing. These features contribute to its biodiversity, cultural and heritage value.
Veteran trees can be classified if they have four out of the five following features:

1. Rot sites associated with wounds which are decaying >400 cm^2;
2. Holes and water pockets in the trunk and mature crown >5 cm diameter;
3. Dead branches or stems >15 cm diameter;
4. Any hollowing in the trunk or major limbs;
5. Fruit bodies of fungi known to cause wood decay.

Footnote 3 - Mature trees are close to their full height and crown size, these dimensions being determined by species and site factors. Late-mature trees are still close to their full height and crown size while main-stem diameter (which by now is large) increases more slowly.

APPENDIX C: Hedgerow condition assessment information

Table 30: Details of the baseline hedgerow condition assessment

Condition Criteria	Aspect	Requirement	Description	Native Species Rich Hedgerow	Native Hedgerow intact	Native Species Rich Hedgerow	Native Hedgerow with trees	Native Species Rich Hedgerow	Native Hedgerow with trees +ditch	Native Species Rich Hedgerow	Native Hedgerow + ditch	Native hedgerow defunct
A1.	Height	>1.5 m average along length	The average height of woody growth estimated from base of stem to the top of shoots, excluding any bank beneath the hedgerow, any gaps or isolated trees. Newly laid or coppiced hedgerows are indicative of good management and pass this criterion for up to a maximum of four years (if undertaken according to good practice). A newly planted hedgerow does not pass this criterion (unless it is > 1.5 m height).	1	1	1	1	1	1	1	1	1
A2.	Width	>1.5 m average along length	The average width of woody growth estimated at the widest point of the canopy, excluding gaps and isolated trees. Outgrowths (e.g., blackthorn suckers) are only included in the width estimate when they >0.5 m in height. Laid, coppiced, cut and newly	1	1	1	1	1	1	1	1	1

Condition Criteria	Aspect	Requirement	Description	Native Species Rich Hedgerow	Native Hedgerow intact	Native Species Rich Hedgerow	Native Hedgerow with trees	Native Species Rich Hedgerow	Native Hedgerow with trees +ditch	Native Species Rich Hedgerow	Native Hedgerow + ditch	Native hedgerow defunct
			planted hedgerows are indicative of good management and pass this criterion for up to a maximum of four years (if undertaken according to good practice[4]).									
B1.	Gap - hedge base	Gap between ground and base of canopy <0.5 m for >90% of length (unless 'line of trees')	This is the vertical gappiness of the woody component of the hedgerow, and its distance from the ground to the lowest leafy growth. Certain exceptions to this criterion are acceptable (see page 65 of the Hedgerow Survey Handbook).	1	1	1	1	1	1	1	1	1
B2.	Gap - hedge canopy continuity	· Gaps make up <10% of total length and · No canopy gaps >5 m	This is the horizontal gappiness of the woody component of the hedgerow. Gaps are complete breaks in the woody canopy (no matter how small). Access points and gates contribute to the overall gappiness but are not subject to the >5 m criterion (as this is the typical size of a gate).	1	1	1	1	1	1	1	1	0

Condition Criteria	Aspect	Requirement	Description	Native Species Rich Hedgerow	Native Hedgerow intact	Native Species Rich Hedgerow	Native Hedgerow with trees	Native Species Rich Hedgerow	Native Hedgerow with trees +ditch	Native Species Rich Hedgerow	Native Hedgerow + ditch	Native hedgerow defunct
C1.	Undisturbed ground and perennial vegetation	>1 m width of undisturbed ground with perennial herbaceous vegetation for >90% of length: · measured from outer edge of hedgerow, and · is present on one side of the hedge (at least)	This is the horizontal gappiness of the woody component of the hedgerow. Gaps are complete breaks in the woody canopy (no matter how small). Access points and gates contribute to the overall gappiness but are not subject to the >5 m criterion (as this is the typical size of a gate).	1	1	1	1	1	1	1	1	0
C2.	Undesirable perennial vegetation	Plant species indicative of nutrient enrichment of soils dominate <20% cover of the area of undisturbed ground	The indicator species used are nettles (Urtica spp.), cleavers (Galium aparine) and docks (Rumex spp.). Their presence, either singly or together, should not exceed the 20% cover threshold.	0	0	0	0	0	0	0	0	0

Condition Criteria	Aspect	Requirement	Description	Native Species Rich Hedgerow	Native Hedgerow intact	Native Species Rich Hedgerow	Native Hedgerow with trees	Native Species Rich Hedgerow	Native Hedgerow with trees +ditch	Native Species Rich Hedgerow	Native Hedgerow + ditch	Native hedgerow defunct
D1.	Invasive and neophyte species	>90% of the hedgerow and undisturbed ground is free of invasive non-native and neophyte species	Neophytes are plants that have naturalised in the UK since AD 1500. For information on neophytes see the JNCC website and for information on invasive non-native species see the GB Non-Native Secretariat website.	1	1	1	1	1	1	1	1	1
D2.	Current damage	>90% of the hedgerow or undisturbed ground is free of damage caused by human activities	This criterion addresses damaging activities that may have led to or lead to deterioration in other attributes. This could include evidence of pollution, piles of manure or rubble, or inappropriate management practices (e.g., excessive hedge cutting).	1	1	1	1	1	1	1	1	1
E1.	Tree age	At least one mature tree per 30m stretch of hedgerow. A mature tree is one that is at	This criterion addresses if there are sufficient mature trees (within the scope of planning timescales) which are of higher value to biodiversity.			1	1	1	1			

Condition Criteria	Aspect	Requirement	Description	Native Species Rich Hedgerow	Native Hedgerow intact	Native Species Rich Hedgerow	Native Hedgerow with trees	Native Species Rich Hedgerow	Native Hedgerow with trees +ditch	Native Species Rich Hedgerow	Native Hedgerow + ditch	Native hedgerow defunct
		least 2/3 expected fully mature height for the species.										
E2.	Tree health	At least 95% of hedgerow trees are in a healthy condition (excluding veteran features valuable for wildlife). There is little or no evidence of an adverse impact on tree health by damage from livestock or wild animals, pests or diseases, or human activity.	This criterion identifies if the trees are subject to damage which compromises the survival and health of the individual specimens.			1	1	1	1			

APPENDIX D: Post Development Land Use Typology Breakdown

Polygon No.	Polygon type	Area in Sq. mt	Area in Ha	Habitat Grouping	Habitat Breakdown	Comments
0	Existing Woods Outside	225.95	0.0226	Existing habitat	See baseline	Leave as is, not being impacted or enhanced
1	Proposed Potential Accessibility	4204.45	0.4204	Zero value parcels	100% developed land; sealed surface	No soft landscaping proposed
2	Proposed High School	6557.46	0.6557	Proposed school area	80% developed land; sealed surface 10% Modified grassland - Moderate condition 5% ornamental shrubs 5% Urban trees - Moderate condition	All scalped amenit type grassland has been cut out for playing fields, othe grassland assumed to be a bit less intensively managed. Moderate condition potentially viable for Urban trees if species mostly native
3	Proposed School Area	9997.60	0.9998	Proposed school area	80% developed land; sealed surface 10% Modified grassland - Moderate condition 5% ornamental shrubs 5% Urban trees - Moderate condition	All scalped amenit type grassland has been cut out for playing fields, othe grassland assumed to be a bit less intensively managed. Moderate condition potentially viable for Urban trees if species mostly native
4	Proposed School Area	12310.43	1.2310	Proposed school area	80% developed land; sealed surface 10% Modified grassland - Moderate condition 5% ornamental shrubs 5% Urban trees - Moderate condition	All scalped amenit type grassland has been cut out for playing fields, othe grassland assumed to be a bit less intensively managed. Moderate condition potentially viable for Urban trees if species mostly native
5	Proposed School Area	14781.17	1.4781	Proposed school area	80% developed land; sealed surface 10% Modified grassland - Moderate condition 5% ornamental shrubs 5% Urban trees - Moderate condition	All scalped amenit type grassland has been cut out for playing fields, othe grassland assumed to be a bit less intensively managed. Moderate condition potentially viable for Urban trees if species mostly native
6	Proposed School Area	7047.14	0.7047	Proposed school area	80% developed land; sealed surface 10% Modified grassland - Moderate condition 5% ornamental shrubs 5% Urban trees - Moderate condition	All scalped amenit type grassland has been cut out for playing fields, othe grassland assumed to be a bit less intensively managed. Moderate condition potentially viable for Urban trees if species mostly native
7	Proposed Suds Water Management	9949.41	0.9949	SUDs	15% Other neutral grassland - Good condition 40% Lowland meadow - Good condition 5% Modified grassland - Good condition 10% Mixed scrub - Moderate condition 5% developed land; sealed surface 10% Other woodland; broadleaved - Moderate condition 5% reedbeds - Good condition 10% Ponds (Priority habitat) - Good condition	A variety of grassland types has been chosen to account for differing levels of access pressure, good condition is achieveable for all of these under appropriate management Any mixed scrub and woodland provided would likely be fairly patchy and not allow the parcels to meet all the criteria required for Good condition Most, if not all, of the ponds in these SUDs would be away from commonly accessed areas and so good condition possible under appropriate management Good condition achievable for reedbeds in theory but moderate may be more likely, have put good for now but may change depending on how calcs come out
8	Proposed Suds Water Management	2740.56	0.2741	SUDs	15% Other neutral grassland - Good condition 40% Lowland meadow - Good condition 5% Modified grassland - Good condition 10% Mixed scrub - Moderate condition 5% developed land; sealed surface 10% Other woodland; broadleaved - Moderate condition 5% reedbeds - Good condition 10% Ponds (Priority habitat) - Good condition	A variety of grassland types has been chosen to account for differing levels of access pressure, good condition is achieveable for all of these under appropriate management Any mixed scrub and woodland provided would likely be fairly patchy and not allow the parcels to meet all the criteria required for Good condition Most, if not all, of the ponds in these SUDs would be away from commonly accessed areas and so good condition possible under appropriate management Good condition achievable for reedbeds in theory but moderate may be more likely, have put good for now but may change depending on how calcs come out
9	Proposed Suds Water Management	2717.11	0.2717	SUDs	15% Other neutral grassland - Good condition 40% Lowland meadow - Good condition 5% Modified grassland - Good condition 10% Mixed scrub - Moderate condition 5% developed land; sealed surface 10% Other woodland; broadleaved - Moderate condition 5% reedbeds - Good condition 10% Ponds (Priority habitat) - Good condition	A variety of grassland types has been chosen to account for differing levels of access pressure, good condition is achieveable for all of these under appropriate management Any mixed scrub and woodland provided would likely be fairly patchy and not allow the parcels to meet all the criteria required for Good condition Most, if not all, of the ponds in these SUDs would be away from commonly accessed areas and so good condition possible under appropriate management Good condition achievable for reedbeds in theory but moderate may be more likely, have put good for now but may change depending on how calcs come out
10	Proposed Suds Water Management	15092.26	1.5092	SUDs	15% Other neutral grassland - Good condition 40% Lowland meadow - Good condition 5% Modified grassland - Good condition 10% Mixed scrub - Moderate condition 5% developed land; sealed surface 10% Other woodland; broadleaved - Moderate condition 5% reedbeds - Good condition 10% Ponds (Priority habitat) - Good condition	A variety of grassland types has been chosen to account for differing levels of access pressure, good condition is achieveable for all of these under appropriate management Any mixed scrub and woodland provided would likely be fairly patchy and not allow the parcels to meet all the criteria required for Good condition Most, if not all, of the ponds in these SUDs would be away from commonly accessed areas and so good condition possible under appropriate management Good condition achievable for reedbeds in theory but moderate may be more likely, have put good for now but may change depending on how calcs come out
11	Proposed Development Areas.	17960.69	1.7961	Proposed development areas	60% developed land; sealed surface 30% vegetated gardens 5% ornamental scrub 5% urban trees - Moderate	This is an assumed average across the various types of development area, if it looks like it may be a deciding factor on meeting the net gain threshold it ca be refined
12	Proposed Burial Ground	23364.02	2.3364	Proposed burial ground	5% developed land; unsealed surface 65% other woodland broadleaved - Moderate condition 30% other neutral grassland - good condition	Seems to be a variety of different designs of woodland burial. Some are almost entirely woodland while others are quite open. I've gone for a theoretical design that incorporates areas of denser woodland and more open wood-pasture type habitat. I've assumed moderate condition for the woodland as there will need to be a certain degree of "presentability" and aceess needed and this would preclude several of the natural features required for good condition in woodland. Land use means lowland meadow likely not viable but the low access levels mean that Good condition of oter neutral grassland should be fine
13	Proposed Allotments	20872.99	2.0873	Allotments	100% allotments moderate condition	I'd say Moderate is best we can hope for if we're being conservative, potential for passing all criteria there but lack of control over this land makes maintaining it difficult
14	Proposed Allotments	15726.68	1.5727	Allotments	100% allotments moderate condition	I'd say Moderate is best we can hope for if we're being conservative, potential for passing all criteria there but lack of control over this land makes maintaining it difficult
15	Proposed Allotments	10482.67	1.0483	Allotments	100% allotments moderate condition	I'd say Moderate is best we can hope for if we're being conservative, potential for passing all criteria there but lack of control over this land makes maintaining it difficult
16	Proposed Allotments	5148.25	0.5148	Allotments	100% allotments moderate condition	I'd say Moderate is best we can hope for if we're being conservative, potential for passing all criteria there but lack of control over this land makes maintaining it difficult
17	Proposed Sport Field	7466.92	0.7467	Proposed sport field	100% Modified grassland - Poor condition	Would be scalped amenity, no better than poor possible
18	Proposed Suds Hatch	2912.28	0.291228	SUDs	15% Other neutral grassland - Good condition 40% Lowland meadow - Good condition 5% Modified grassland - Good condition 10% Mixed scrub - Moderate condition 5% developed land; sealed surface 10% Other woodland; broadleaved - Moderate condition 5% reedbeds - Good condition 10% Ponds (Priority habitat) - Good condition	A variety of grassland types has been chosen to account for differing levels of access pressure, good condition is achieveable for all of these under appropriate management Any mixed scrub and woodland provided would likely be fairly patchy and not allow the parcels to meet all the criteria required for Good condition Most, if not all, of the ponds in these SUDs would be away from commonly accessed areas and so good condition possible under appropriate management Good condition achievable for reedbeds in theory but moderate may be more likely, have put good for now but may change depending on how calcs come out
19	Proposed Suds Hatch	2456.52	0.2457	SUDs	15% Other neutral grassland - Good condition 40% Lowland meadow - Good condition 5% Modified grassland - Good condition 10% Mixed scrub - Moderate condition 5% developed land; sealed surface 10% Other woodland; broadleaved - Moderate condition 5% reedbeds - Good condition 10% Ponds (Priority habitat) - Good condition	A variety of grassland types has been chosen to account for differing levels of access pressure, good condition is achieveable for all of these under appropriate management Any mixed scrub and woodland provided would likely be fairly patchy and not allow the parcels to meet all the criteria required for Good condition Most, if not all, of the ponds in these SUDs would be away from commonly accessed areas and so good condition possible under appropriate management Good condition achievable for reedbeds in theory but moderate may be more likely, have put good for now but may change depending on how calcs come out
20	Proposed Suds Hatch	1867.25	0.1867	SUDs	15% Other neutral grassland - Good condition 40% Lowland meadow - Good condition 5% Modified grassland - Good condition 10% Mixed scrub - Moderate condition 5% developed land; sealed surface 10% Other woodland; broadleaved - Moderate condition 5% reedbeds - Good condition 10% Ponds (Priority habitat) - Good condition	A variety of grassland types has been chosen to account for differing levels of access pressure, good condition is achieveable for all of these under appropriate management Any mixed scrub and woodland provided would likely be fairly patchy and not allow the parcels to meet all the criteria required for Good condition Most, if not all, of the ponds in these SUDs would be away from commonly accessed areas and so good condition possible under appropriate management Good condition achievable for reedbeds in theory but moderate may be more likely, have put good for now but may change depending on how calcs come out
21	Proposed Suds Hatch	2534.37	0.2534	SUDs	15% Other neutral grassland - Good condition 40% Lowland meadow - Good condition 5% Modified grassland - Good condition 10% Mixed scrub - Moderate condition 5% developed land; sealed surface 10% Other woodland; broadleaved - Moderate condition 5% reedbeds - Good condition 10% Ponds (Priority habitat) - Good condition	A variety of grassland types has been chosen to account for differing levels of access pressure, good condition is achieveable for all of these under appropriate management Any mixed scrub and woodland provided would likely be fairly patchy and not allow the parcels to meet all the criteria required for Good condition Most, if not all, of the ponds in these SUDs would be away from commonly accessed areas and so good condition possible under appropriate management Good condition achievable for reedbeds in theory but moderate may be more likely, have put good for now but may change depending on how calcs come out
22	Proposed Suds Hatch	820.09	0.0820	SUDs	15% Other neutral grassland - Good condition 40% Lowland meadow - Good condition 5% Modified grassland - Good condition 10% Mixed scrub - Moderate condition 5% developed land; sealed surface 10% Other woodland; broadleaved - Moderate condition 5% reedbeds - Good condition 10% Ponds (Priority habitat) - Good condition	A variety of grassland types has been chosen to account for differing levels of access pressure, good condition is achieveable for all of these under appropriate management Any mixed scrub and woodland provided would likely be fairly patchy and not allow the parcels to meet all the criteria required for Good condition Most, if not all, of the ponds in these SUDs would be away from commonly accessed areas and so good condition possible under appropriate management Good condition achievable for reedbeds in theory but moderate may be more likely, have put good for now but may change depending on how calcs come out

Intesive green roof - Good condition	24.28119659

A comparable development (Northstowe, Cambridgshire) had a minimum of 20 urban trees planted per ha of development. Which works out as approximately 10% of the area using a medium tree on the street tree helper. As otterpoool is a garden town and the GI strategy inculudes numerous commitments to street tree planting it is considered that this is a precautionary estimate of the street trees provided

APPENDIX H: Post-development river condition indicators

Table 31: Post-development river condition indicators

Condition indicator code	Assessment rationale	Indicator score
B1	Assumed three types of vegetation Present or Extensive on each bank – tall herbs, scrub and trees.	2
B2	Assumed fallen trees or large wood (>1m long and >10cm diameter) present on each bank along whole river corridor.	2
B3	Extensive swales, basins, ponds and wetlands will be created along the East Stour River. These features will align with the ponds and wetlands, with either short or tall non-woody vegetation, typologies. It is expected that on average across the river corridor there will be one such feature that is extensive on one of the banks. The locations of proposed wetland features are shown in Figure 7 in Chapter 15 Appendix 2.	2
B4	Assumed no non-native invasive species (NNIS) will be present with appropriate management.	0
B5	Assumed no managed ground cover typologies within 10m of the bank top.	0
C1	Assumed four types of vegetation Present or Extensive on each bank – short grass, tall herbs, scrub and trees.	3
C2	Assumed same score as in the baseline. The average score across the East Stour and East Stour tributary is 1.1. It is difficult to improve this score, other than allowing deadwood of varying sizes to remain. It is not expected that such features will be extensive enough to result in indicator value/score.	1
C3	Assumed the same number of bank profiles as in the baseline as extensive bank works are not expected.	2.43
C4	Assume same number of bank profile types as present	3.57
C5	Assume same number of bank materials as present	1.49
C6	Assumed low bare ground on banks as likely to be vegetated and without heavy grazing and poaching to reduce vegetation cover. Baseline scores are 2.13 and 3.57 for East Stour and East Stour tributary respectively, so assumed similar level of bare ground to in baseline.	2
C7	No significant artificial banks expected. Proposed bridges are clear span.	0
C8	No significant artificial banks expected. Proposed bridges are clear span.	0

Condition indicator code	Assessment rationale	Indicator score
C9	No significant artificial banks expected. Proposed bridges are clear span.	0
C10	Assumed no NNIS will be present with appropriate management.	0
D1	Assumed emergent vegetation will be present throughout watercourses in the channel margin. Based upon existing level of such vegetation, there is not expected to be sufficient amounts of 'extensive' coverage to result in a higher indicator score. Slight increase in marginal vegetation expected due to lack of poaching from sheep and cattle.	2
D2	Assumed two types of marginal vegetation P or E within an average stretch. Reduced nutrient enrichment from agricultural land is expected to encourage greater diversity. Translocation/planting of plants will also increase diversity. Low levels currently present, so precautionary approach taken to achievable level of uplift.	2
D3	Assumed to be the same as baseline due to the complexity of encouraging the development of natural physical features.	1.05
D4	Assumed to be the same as baseline due to the complexity of encouraging the development of natural physical features.	1.08
D5	No significant jetties, deflectors, pies in baseline, so it is assumed that none will be added, with Sustainable Drainage Systems features proposed.	0
E1	Due to low levels of aquatic morphotype richness, it is assumed that only 1 type of aquatic vegetation will be present within a module. This will be encouraged by the reduction of agricultural pollution from land use change.	1
E2	Typically, two channel bed tree features are present in the baseline (vegetation shading channel and exposed roots). It is not expected that two additional features (e.g., large wood, fallen tree) will be present to result in an indicator score of three.	2
E3	Assumed to be the same as baseline due to the complexity of encouraging the development of natural physical features. Baseline score average is 0.98, so this score is assumed.	1.30
E4	Assumed to be the same as baseline due to the complexity of encouraging the development of natural physical features. Baseline score average is 0.93, so this score is assumed.	0.93

Condition indicator code	Assessment rationale	Indicator score
E5	Assumed to be the same as baseline due to the complexity of encouraging the development of natural physical features. Baseline score average is 0.60, so this score is assumed.	0.60
E6	Assumed three types of bed material P and E in the baseline (silt, sand and gravel-pebble) will still be dominant post development. Less silt expected due to reduced agricultural run-off.	3
E7	Assumed that siltation will be reduced to P across subreaches due to reduced agricultural run-off.	-2
E8	Assumed no channel bed reinforcement	0
E9	Assumed no channel bed reinforcement	0
E10	Assume intermediate bridge shadow only (up to 25m), which does not score negatively, and bridges are clear span. No significant large trash assumed. Removal of some of the culverts present in the baseline is proposed. Small number of minor culverts are present in the baseline, but these are not considered to be significant contributors to the character of the watercourses.	0
E11	Assumed no non-native invasive species (NNIS) will be present with appropriate management.	0
E12	Assume levels of filamentous algae will be somewhat reduced by the reduction in agricultural runoff. Assumed minor improvement from baseline score of -1.66 to -1.	-1

Surveyor	CV details
Brandon Murray (Associate Technical Director) BSc(hons) MCIEEM	Brandon has been a professional ecologist for over eleven years and has been conducting biodiversity net gain assessments for over four years.
Tobias Betts (Graduate Ecologist) BSc MSc ACIEEM	Tobias has been a professional ecologist for 3 years and has been undertaking biodiversity net gain assessments using the Defra Metric 2.0 and 3.0 for most of that time.
Liam Price (Ecologist) MBiol (hons) ACIEEM	Liam has been a professional ecologist for over 3 years. During this time, he has gained extensive experience with biodiversity net gain assessments, including on large scale infrastructure projects. Liam is qualified to carry out river condition assessments.
